**(μPD78310A/312A/P312A)**  
**16-/8-Bit, K-Series Microcontrollers**  
**With Real-Time Output Ports**

September 1993

**Description**

The μPD78310A, μPD78312A, and μPD78P312A are members of the K-Series® of microcontrollers and are designed for use in process control. They perform all the usual process control functions and are particularly well-suited for driving stepping motors and dc motors in servo loops. The processors include on-chip memory, timers, input/output registers, and a powerful interrupt handling facility. The μPD78310A/312A is constructed of high-speed CMOS circuitry and operates from a single +5-volt power supply.

The input frequency (maximum 12 MHz) is derived from an external crystal or an external oscillator. The internal processor clock is two-phase, and thus machine states are executed at a rate of 6 MHz. The shortest instructions require three states, making the minimum time 500 ns. The CPU contains a three-byte instruction prefetch queue, which allows a subsequent instruction to be fetched during execution of an instruction that does not reference memory.

Program memory is 8K bytes of mask-programmable ROM (μPD78312A only), and data memory is 256 bytes of static RAM. The μPD78310A is the ROMless version. μPD78P312A is a prototyping chip for μPD78312A. It has an on-chip 8K EPROM instead of a mask ROM.

**Features**

- Complete single-chip microcontroller
  - 16-bit ALU
  - 8K ROM (μPD78312A only)
  - 256 bytes RAM
  - 1-bit and 8-bit logic
- Instruction prefetch queue
- 16-bit unsigned multiply and divide
- String instructions
- Memory expansion
  - 8085A bus-compatible
  - Total 64K address space
- Large I/O capacity: up to 32 I/O port lines
- Extensive timer/counter system
  - Two 16-bit up/down counters
  - Quadrature counting
  - Two 16-bit timers
  - Free-running counter with two 16-bit capture registers
  - Pulse-width modulated outputs
  - Timebase counter
- Four-channel 8-bit A/D converter
- Two 4-bit real-time output ports
- Two nonmaskable interrupts
- Eight hardware priority interrupt levels
- Macro service facility for interrupts gives the effect of eight DMA channels
- Bidirectional serial port
  - Either UART or interface mode
  - Dedicated baud rate generator
- Watchdog timer
- Refresh output for pseudostatic RAM
- Programmable HALT and STOP modes
- One-byte call instruction
- On-chip clock generator
- CMOS silicon gate technology
- +5-volt power supply

### Pin Identification

Symbol	Function
AN0 - AN3	A/D converter inputs
ALE	Address latch enable output
EA/V <sub>pp</sub>	External access control input; programming voltage
P0 <sub>7</sub> - P0 <sub>0</sub>	I/O port 0
P1 <sub>7</sub> - P1 <sub>0</sub>	I/O port 1
P2 <sub>0</sub> /NMI	Nonmaskable interrupt input
P2 <sub>1</sub> - P2 <sub>3</sub> / INTE0 - INTE2	Maskable interrupt inputs
P2 <sub>4</sub> /TxD	I/O port 2; serial transmit output
P2 <sub>5</sub> /RxD	I/O port 2; serial receive input
P2 <sub>6</sub> /SCK	I/O port 2; serial clock output
P2 <sub>7</sub> /CTS	I/O port 2; clear to send input
P3 <sub>0</sub> /C10	Up/down counter 0 input
P3 <sub>1</sub> /CTRL0	Up/down counter 0 control input
P3 <sub>2</sub> /C11	Up/down counter 1 input
P3 <sub>3</sub> /CTRL1	Up/down counter 1 control input
P3 <sub>4</sub> /PWM0	I/O port 3; pulse width modulated output 0
P3 <sub>5</sub> /PWM1	I/O port 3; pulse width modulated output 1
P3 <sub>6</sub> /CLR0/TO0	I/O port 3; counter 0 clear input timer 0 output
P3 <sub>7</sub> /CLR1/TO1	I/O port 3; counter 1 clear input; timer 1 output
P4 <sub>7</sub> - P4 <sub>0</sub> /AD <sub>7</sub> - AD <sub>0</sub>	I/O port 4; external address/data bus
P5 <sub>7</sub> - P5 <sub>0</sub> /A <sub>15</sub> - A <sub>8</sub>	I/O port 5, high address byte output
RD	Read strobe output
RESET/PROG	External reset input; PROM programming mode
RFSH	Refresh output
WR	Write strobe output
X1	External crystal or external clock input
X2	External crystal
AV <sub>REF</sub>	A/D reference voltage
AV <sub>SS</sub>	Analog ground
V <sub>DD</sub>	Power supply
V <sub>SS</sub>	Power return

### Pin Functions

**AN0 - AN3 (A/D Converter Inputs).** AN0 - AN3 are the four program selectable input channels for the A/D converter.

**ALE (Address Latch Enable).** ALE is the address latch enable. It is to be used by external circuitry to latch the low-order 8 address bits during the first part of a read or write cycle.

**EA/V<sub>pp</sub>.** On μPD78312A, a low on  $\overline{EA}$  enables use of external memory in place of on-chip ROM. The EA pin must be low on μPD78310A. On the μPD78P312A, this pin is used for programming voltage. In normal operation, it must be connected to V<sub>DD</sub>.

**P0<sub>7</sub> - P0<sub>0</sub> (Port 0).** Port 0 consists of 8 bits, individually programmable for input/output or two 4-bit real-time (timer controlled) output ports.

**P1<sub>7</sub> - P1<sub>0</sub> (Port 1).** Port 1 consists of 8 bits, individually programmable for input/output.

**P2<sub>0</sub>/NMI (Port 2; Nonmaskable Interrupt).** Port P2<sub>0</sub> is dedicated to NMI, the nonmaskable external interrupt request.

**P2<sub>1</sub> - P2<sub>3</sub>/INTE0-INTE2 (Port 2; Maskable Interrupts).** Ports P2<sub>1</sub> - P2<sub>3</sub> are dedicated to INTE0, INTE1, and INTE2, the maskable external interrupt requests.

**P2<sub>4</sub>/TxD (Port 2; Serial Transmit).** P2<sub>4</sub> is an I/O port bit or the transmitted serial data output.

**P2<sub>5</sub>/RxD (Port 2; Serial Receive).** P2<sub>5</sub> is an I/O port bit or the received serial data input.

**P2<sub>6</sub>/SCK (Port 2; Serial Clock).** P2<sub>6</sub> is an I/O port bit or the serial shift clock output.

**P2<sub>7</sub>/CTS (Port 2; Clear to Send).** P2<sub>7</sub> is an I/O port bit or clear-to-send input (external serial transmission control) in the asynchronous communication mode. In the serial I/O interface mode, it becomes the serial receive clock I/O pin.

**$\mu$ PD78312A Family**

**P3<sub>0</sub>/C10 (Port 3; Counter 0).** Port P3<sub>0</sub> is dedicated to C10, the external count input for up/down counter 0.

**P3<sub>1</sub>/CTRL0 (Port 3; Counter 0 Control).** Port P3<sub>0</sub> is dedicated to CTRL0, the external control input for up/down counter 0.

**P3<sub>2</sub>/C11 (Port 3; Counter 1).** Port P3<sub>2</sub> is dedicated to C11, the external count input for up/down counter 1.

**P3<sub>3</sub>/CTRL1 (Port 3; Counter 1 Control).** Port P3<sub>3</sub> is dedicated to CTRL1, the external control input for up/down counter 1.

**P3<sub>4</sub>/PWM0 (Port 3; Pulse Width 0).** P3<sub>4</sub> is an I/O port bit or the pulse-width modulated output 0.

**P3<sub>5</sub>/PWM1 (Port 3; Pulse Width 1).** P3<sub>5</sub> is an I/O port bit or the pulse-width modulated output 1.

**P3<sub>6</sub>/CLR0/TO0 (Port 3; Counter 0 Clear; Timer 0).** P3<sub>6</sub> is an I/O port bit, or the clear input for up/down counter 0, or the timer 0 flip-flop output.

**P3<sub>7</sub>/CLR1/TO1 (Port 3; Counter 1 Clear; Timer 1).** P3<sub>7</sub> is an I/O port bit, or the clear input for up/down counter 1, or the timer 1 flip-flop output.

**P4<sub>0</sub> - P4<sub>7</sub>/AD<sub>0</sub> - AD<sub>7</sub> (Port 4; External Address/Data Bus).** Port 4 consists of 8 bits, programmable as a unit for input or output, or as the multiplexed address/data bus if external memory or external interface circuitry is used. The port is controlled by the memory mapping register. If the EA pin is low, port 4 is always an address/data bus.

**P5<sub>0</sub> - P5<sub>7</sub>/A<sub>8</sub> - A<sub>15</sub> (Port 5; High-Address Byte).** Port 5 consists of 8 bits, individually programmable for input or output, or the high-order address bits for external memory. Under control of the memory mask register, bits P5<sub>3</sub> - P5<sub>0</sub> are used for 4K memory expansion, bits P5<sub>5</sub> - P5<sub>0</sub> for 16K memory expansion, or bits P5<sub>7</sub> - P5<sub>0</sub> for 56K memory expansion. If the EA pin is low, port 5 is always the high-order address bus.

**RD (Read Strobe).** RD is the read strobe output. It is to be used by external memory (or data registers) to place data on the I/O bus during a read operation.

**RESET/PROG.** This pin is used for the external reset input. A low level sets all registers to their specified reset values. During programming of the  $\mu$ PD78P312A, this pin is used to place the device into PROM programming mode.

**RFSH (Refresh).** RFSH is the refresh pulse output to be used for external pseudostatic RAM.

**WR (Write Strobe).** WR is the write strobe output. It is to be used by external memory (or data registers) to latch data from the I/O bus during a write operation.

**X1, X2 (External Crystal or Clock Input).** X1 and X2 are the external oscillator inputs or the connections for an external crystal. If an external clock is used, it is connected to X1 and its inverse is connected to X2. The system clock frequency is half the input frequency.

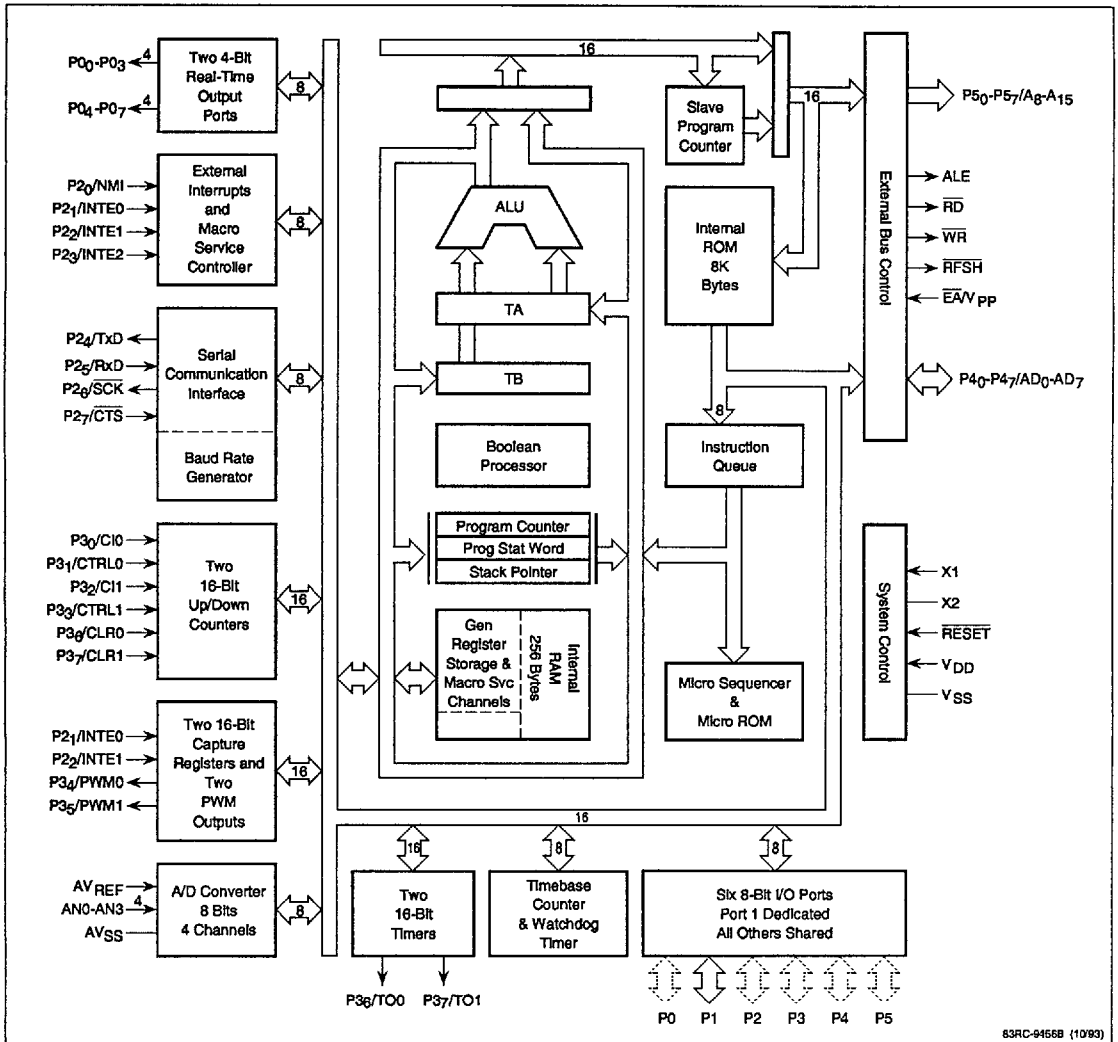

**AV<sub>REF</sub> (A/D Reference Voltage).** AV<sub>REF</sub> is the reference voltage input for the A/D converter.

**AV<sub>SS</sub> (Analog Ground).** AV<sub>SS</sub> is the analog ground pin.

**V<sub>DD</sub> (Power Supply).** V<sub>DD</sub> is the positive power supply input.

**V<sub>SS</sub> (Power Return).** V<sub>SS</sub> is the power supply return, normally ground.

**$\mu$ PD78312A Family****FUNCTIONAL DESCRIPTION**

On-chip features designed to facilitate process control include two 16-bit timers, quadrature counting, two 16-bit up/down counters, two pulse-width modulated outputs, a free-running counter with two capture registers, two 4-bit real-time (timer-controlled) output ports, an 8-bit A/D converter with four input channels, a timebase counter to generate widely spaced interrupts, and a watchdog timer to guard against infinite program loops.

In addition, a serial I/O port can be used in either an interface mode or an asynchronous communication mode. HALT and STOP modes are provided to conserve power at times when CPU action is not required.

All I/O, timer, and control registers are defined as special function registers and assigned addresses in the top 256 bytes of memory. The special function registers may be operated on directly by many of the arithmetic, logic, and move instructions of the CPU. Table 1 describes the registers.

**Addressing**

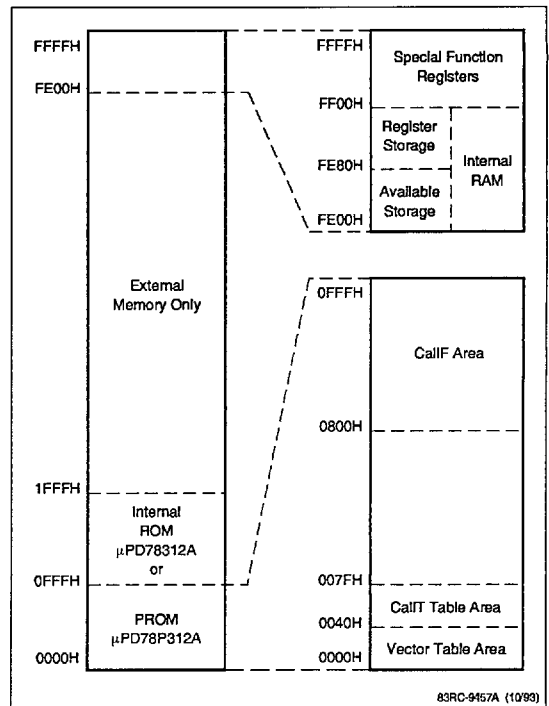

The  $\mu$ PD78312A family features 1-byte addressing of the special function registers and 1-byte addressing of the internal RAM. There are nine modes of addressing main memory, including autoincrement, autodecrement, indexing, and double indexing. There are 8- and 16-bit immediate operands.

**External Memory**

External memory (figure 1) is supported by I/O port 4, an 8-bit multiplexed address/data bus. The memory mapping register controls the size of external memory as well as the number of additional wait states. High-order address bits are taken from I/O port 5 as required. No bits are required for 256 bytes of external memory; bits P<sub>53</sub> - P<sub>50</sub> are used for 4K bytes, P<sub>55</sub> - P<sub>50</sub> for 16K bytes, and P<sub>57</sub> - P<sub>50</sub> for 56K bytes. Any remaining port 5 bits are available for I/O.

**Refresh**

The  $\mu$ PD78312A has a refresh signal for use with the pseudostatic RAM. The refresh cycle can be set to one of four intervals ranging from 2.67 to 21.3  $\mu$ s. The refresh is timed to follow a read or write operation so that there is no interference.

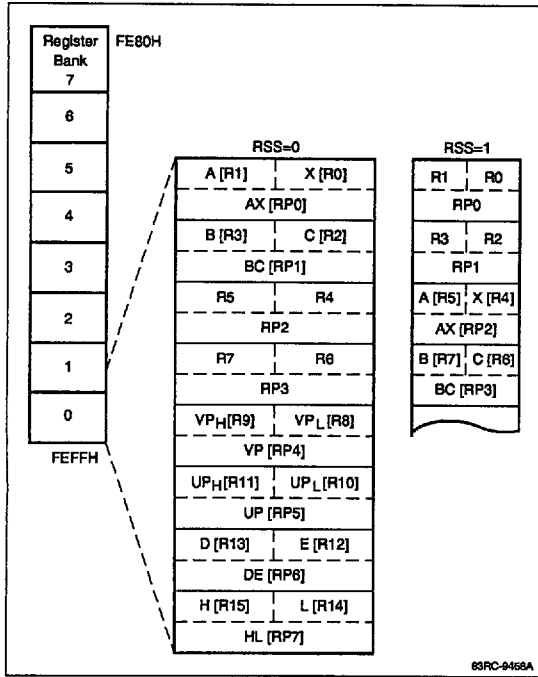

**Figure 1. Memory Map****General Registers**

The CPU has sixteen 8-bit registers (figure 2) that can also be used in pairs to function as 16-bit registers. A complete set of 16 general registers is mapped into each of 8 program-selectable register banks stored in RAM. Three bits in the PSW specify which of the register banks is active at any given time. Each register bank has two program-selectable accumulators.

The general registers of the  $\mu$ PD78312A have both absolute and functional names. AX is the functional name for the accumulator. Setting the RSS bit in the PSW to 1 transfers the AX and BC registers from their normal RP0 and RP1 positions to RP2 and RP3 as shown in figure 2. This adds considerable programming flexibility.

**Figure 2. Register Designation and Storage**

### Program Status Word

Following is the program status word format.

- RB<sub>2</sub> - RB<sub>0</sub> Active register bank number
- IE Interrupt enable
- S Sign (1 if last result was negative)
- Z Zero (1 if last result was zero)
- RSS Register set select
- AC Auxiliary carry (carry out of 3rd bit)
- UF User flag
- P/V Parity or arithmetic overflow
- SUB Subtract (1 if last operation was subtract)
- CY Carry

### Input/Output

All ports may be used for either latched output or high-impedance input. All ports except port 4 are bit-programmable for input or output. Port 0 is used for real-time or normal I/O. Port 1 is used for normal I/O. The low nibble of ports 2 and 3 is always used for control and the high nibble for control or normal I/O. Port 4 is used for the external address/data bus or byte-programmable I/O. Port 5 is used for the high bits of the external address or for normal I/O.

### Real-Time Output Port

The real-time output port shares pins with I/O port 0. The high and low nibbles are treated separately or together. Data is transferred from a buffer to the port latches on either a timer or software command.

### Serial Port

The serial port can operate in UART or interface mode with the baud rate and byte format under program control. The serial port also includes a dedicated baud rate generator.

### Pulse-Width Modulated Outputs

The two independent pulse-width modulated outputs are controlled by two 16-bit modulus registers and counters. There are four programmable repetition rates ranging from 91.6 Hz to 23.4 MHz. Figure 3 shows one of these outputs.

### Timers

The μPD78312A has two 16-bit timers. The inputs to these timers may be the internal clock divided by 6; 12(TM0) or 128. Each timer has an associated modulus register to store the timer count. The timer counts down to zero, sets a flag, reloads from the modulus register, and then counts down again. The timer flags can be used under program control to generate interrupt requests and/or a square-wave output. TM0 also functions optionally as two one-shot timers.

Figure 4 is a diagram of the interval timers.

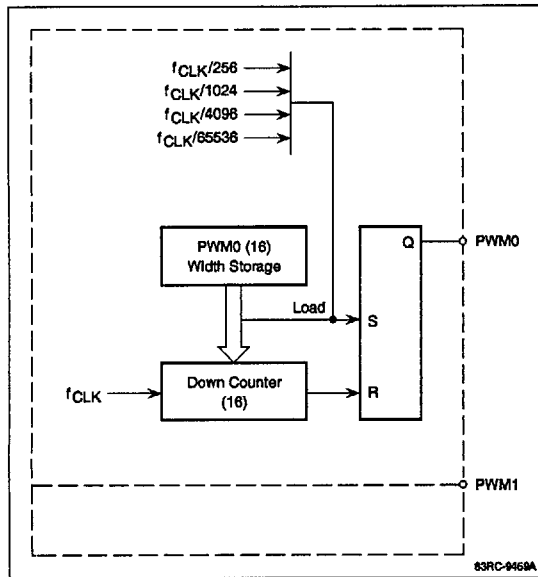

There is a free-running counter that counts the internal clock divided by 4 or by 16. The counter has two 16-bit capture registers. Capture is triggered by an external interrupt request or by the up/down counter clock.

The timebase counter generates a signal at one of four intervals ranging from 170 μs to 175 ms. The signal can be used to generate an interrupt request and/or an up/down counter capture.

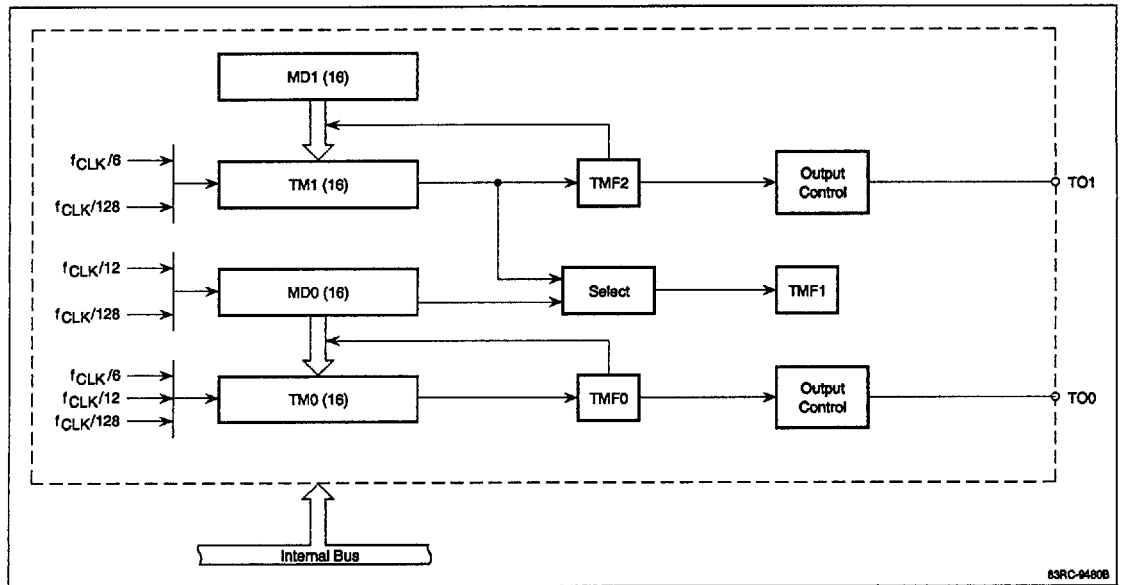

**μPD78312A Family**

**Figure 3. Pulse-Width Modulated Output**

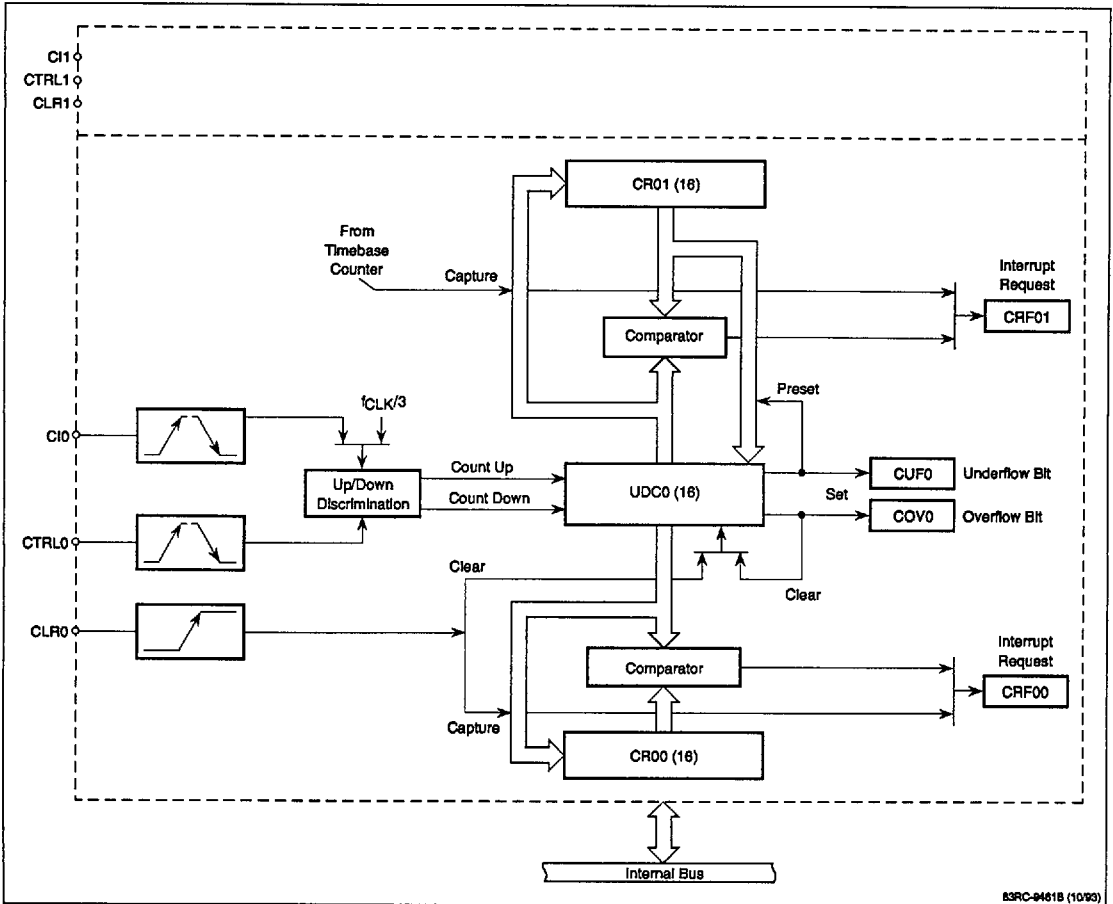

**Figure 4. Timer Block Diagram**

Up/Down Counters

The μPD78312A has two 16-bit up/down counters, each of which has two capture/compare registers. There are three modes of operation: compare and interrupt, capture on external command, and capture on timebase counter command. There are five sources of counts: the internal clock divided by 3, the external clock, external independent up and down inputs, external clock with direction control, and external clock with automatic up/down discrimination. Figure 5 shows an up/down counter.

Figure 5. Up/Down Counter Block Diagram

5a

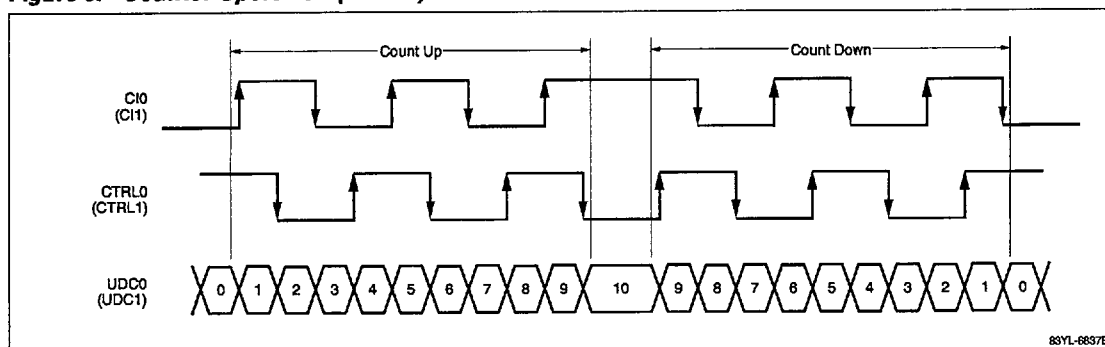

83RC-9461B (10/90)

## μPD78312A Family

### Quadrature Counting

The two up/down counters, UDC0 and UDC1, have an optional quadrature counting mode, which is activated by specifying mode 4 in the counter unit input mode register, CUIM. It is designed to count the output of a two-phase pulsed optical shaft angle encoder. The input for phase A is the C10 (or C11) pin, and the input for phase B is the CTRL0 (or CTRL1) pin. The counter UDC0 (or UDC1) is incremented or decremented at both positive and negative transitions of both input signals. Whether it is incremented or decremented is dependent upon the relative phase of the two signals as illustrated in figure 6.

Figure 6. Counter Operation (Mode 4)

88YL-6637B

### Standby Modes

HALT and STOP modes conserve power when CPU action is not required. In HALT mode, the CPU stops and the clock continues to run. Maskable interrupts can restart the CPU.

In STOP mode, the CPU and clock are both stopped. A RESET pulse or the nonmaskable external interrupt is required to restart them. There is also the option of slowing the system clock by a factor of four. The standby control register controls the standby modes and is a protected location written to only by a special instruction.

### Watchdog Timer

The watchdog timer protects against inadvertent program loops. A nonmaskable interrupt occurs if the timer is not reset before a timeout occurs. There are four program-selectable intervals ranging from 5.5 to 349.3 ms. The watchdog timer can be disabled by software. The watchdog timer mode register controls the watchdog timer and is a protected location written to only by a special instruction.

### A/D Converter

The A/D converter has four input channels and can operate in either scan or select mode. The A/D converter performs 8-bit successive approximation conversions, has a 30-μs conversion time, and is triggered either internally or externally. The A/D converter includes an on-chip sample and hold amplifier.

### Interrupts

There are two nonmaskable interrupt sources: the external nonmaskable interrupt and the watchdog timer. Their relative priorities are software selectable.

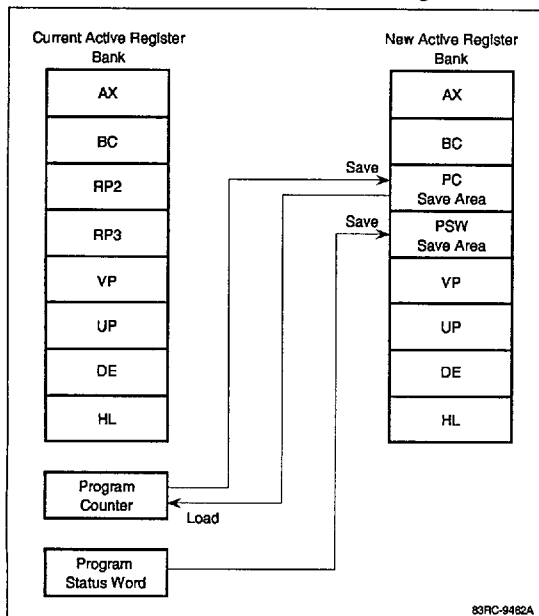

There are eight hardware priority interrupt levels, level 0 having the highest priority and level 7 the lowest. The 15 maskable interrupt sources (table 2) are divided into five groups, and each group can, under program control, be assigned to any one of the priority levels.

Interrupts may be serviced by routines entered either by vectoring or by context switching. Context switching automatically saves all the general registers, the

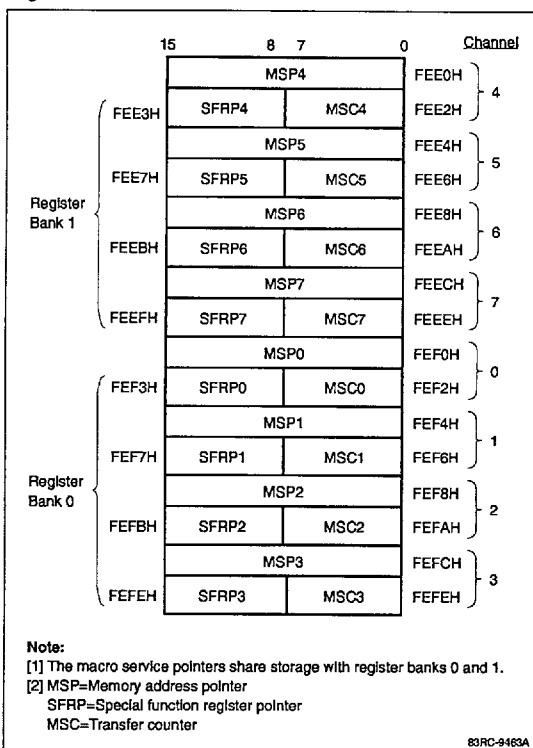

program status word, and the program counter. Figure 7 illustrates the mechanism of context switching.

Finally, an optional macro service function transfers data between any one special function register and memory without program intervention.

**Figure 7. Hardware Context Switching**

**Figure 8. Macro Service Pointer Addresses**

### Macro Service

The macro service controller can be programmed to perform word or byte transfers. It can transfer data from a special function register to memory or from memory to a special function register. Transfer events are triggered by interrupt requests and take place without software intervention.

There are eight macro service channels; channel control information is stored in RAM. This information (figure 8) consists of a 16-bit memory address (optionally incremented at each transfer), and 8-bit special function register designator, and an 8-bit transfer counter (decremented at each transfer). When the count equals 0, a context switch or vectored interrupt occurs.

**Notes:**

- (1) Bits 0-3 of port 2 and of port 3 are read-only.
- (2) POH and POL are 4-bit buffer registers used to store data to be loaded into the high and low nibbles of the real-time output (PO). The high order 4 bits of POH and the low order 4 bits of POL are used.
- (3) Bit 3 of the STBC is not affected by  $\overline{\text{RESET}}$  ( $n = 0$  or  $8$ ).
- (4) External registers interfaced with these addresses can be accessed by special function register addressing.

$V_{DD}$ rise, fall time	$t_{RVD}, t_{FVD}$	200			μs	

**Notes:**

- (1) The internal clock ( $f_{CLK}$ ) equals the oscillation clock ( $f_{XX}$ ) divided by 2 or 8 as determined by bit 5 of the STBC. In this table,  $f_{XX} = 12\text{ MHz}$  and  $f_{CLK} = f_{XX}/2$ .
- (2) During refresh operation, the  $\overline{WR}$  signal falls to low level 1/2 clock cycle later than if there is no refresh.
- (3) When accessing data from pseudostatic RAMs (e.g. μPD4168) with the falling edge of the  $\overline{WR}$  signal, the data setup time is  $t_{SODWF}$  instead of  $t_{SODWR}$ .
- (4) Hold time is measured with  $C_L = 100\text{ pF}$  and  $R_L = 2\text{ k}\Omega$  load, and includes the period necessary to guarantee  $V_{OH}$  and  $V_{OL}$ .
- (5) I/O interface mode transmit data at a data rate of 750 kb/s.
- (6) I/O interface mode receive data, internal clock, at a data rate of 750 kb/s.
- (7) In the I/O interface mode this is the optional external clock for received data at a maximum rate of 1 MB/s.

### Oscillator Characteristics

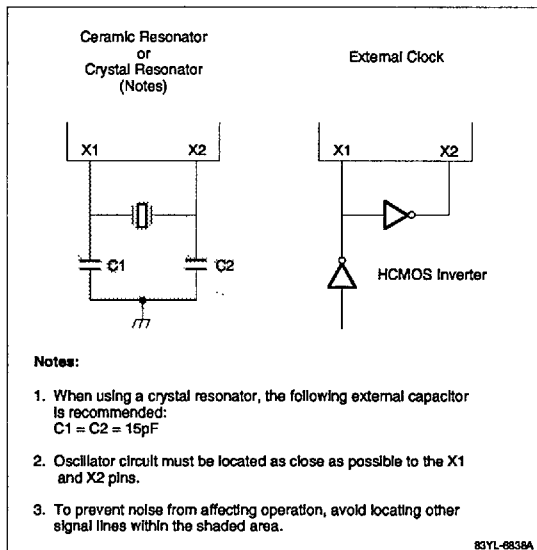

$T_A = -10$  to  $70^\circ\text{C}$ ,  $V_{DD} = +5.0\text{ V} \pm 10\%$ ;  $V_{SS} = AV_{SS} = 0\text{ V}$ ;  
 $4\text{ V} \leq AV_{REF} \leq V_{DD}$

$t_{SODWF}$	$0.5T - 50$		
$t_{DWL}$	$T - 50$		
$t_{WWL}$	$(1.5 + n) - 50$		

#### Notes:

- n is the number of additional wait cycles specified by the MM register.
- $T = t_{CYK} = 1/f_{CLK} = 2/f_{XX}$ .  $f_{CLK}$  is the internal system clock frequency.
- Any parameter not included in this table is not dependent on  $f_{CLK}$ .

**μPD78312A Family**

**PROM PROGRAMMING**

The PROM in the μPD78P312A is an OTP or UVE EPROM with an 8,192 x 8-bit configuration. The pins listed in the table below are used to program the PROM.

When used in the normal operation mode, 5 V ± 10% is applied to the V<sub>DD</sub> and V<sub>PP</sub> pins. A voltage higher than V<sub>DD</sub> should not be applied to other pins.

The programming characteristics of the μPD78P312A are identical to those of the μPD27C256A.

Pin	Function
V <sub>PP</sub>	High voltage input (write/verify mode), high-level input (read mode)
PROG	High voltage input (write/verify mode, read mode)
A <sub>0</sub> - A <sub>7</sub>	Address input (lower 8 bits)
A <sub>8</sub> - A <sub>12</sub>	Address input (upper 8 bits)
D <sub>0</sub> - D <sub>7</sub>	Data input (write mode), data output (verify mode)
CE	Program pulse input
OE	Output enable input
V <sub>DD</sub>	Power supply pin

**Notes:**

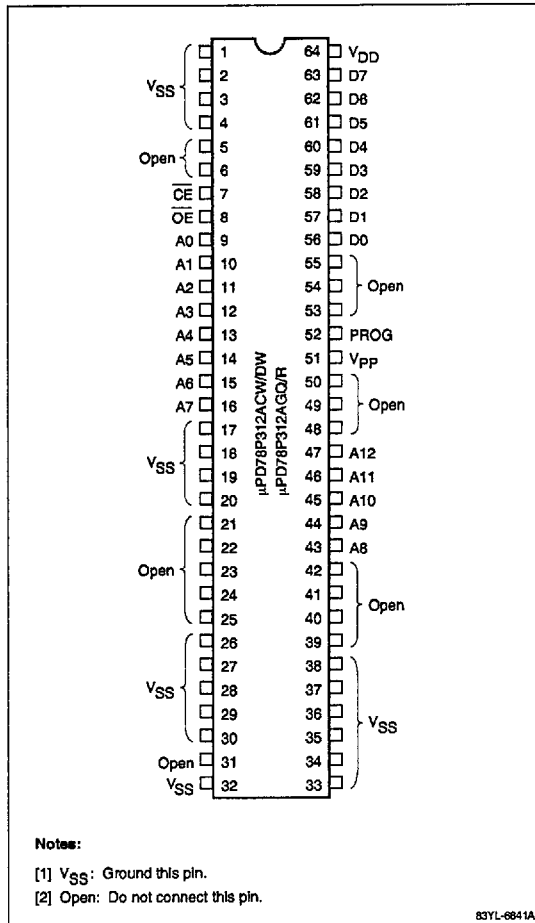

- (1) Mask the window of the UVE EPROM version to protect the PROM from being erased accidentally.
- (2) The OTP EPROM version cannot be erased by ultraviolet rays because it does not have a window.

**Programming Setup**

Programming socket adaptors PA-78P312CW/GF/GQ/L are used to configure the μPD78P312A to fit a standard PROM socket. Set the PROM programmer to program the 27C256A. If the PROM programmer is an older model, check that the programming voltage does not exceed 12.5 volts.

**Pin Functions, PROM Programming Mode**

### Pin Functions, PROM Programming Mode (cont)

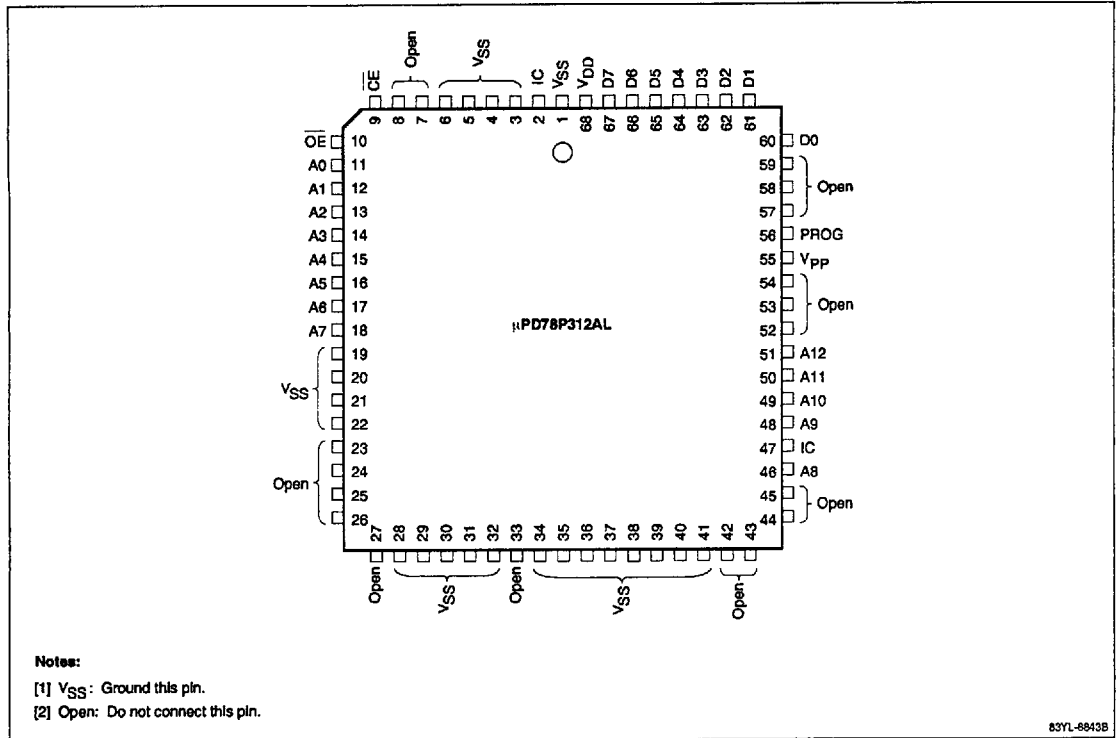

#### 64-Pin Plastic QFP (bent leads)

**μPD78312A Family**

**Pin Functions, PROM Programming Mode (cont)**

**68-Pin PLCC**

## PROM Programming Mode

When +6 V is applied to the  $V_{DD}$  pin and +12.5 V is applied to the PROG pin and  $V_{PP}$  pin, the  $\mu$ PD78P312A enters the program write/verify mode. Operation in this mode is determined by the setting of  $\overline{CE}$  and  $\overline{OE}$  pins as indicated in the table below.

Mode	$\overline{CE}$	$\overline{OE}$	$V_{PP}$	$V_{DD}$	PROG
Write	L	H	+12.5 V	+6V	+12.5 V
Verify	H	L			
Program inhibit	H	H			
Read (Note 2)	L/H	L	+5 V	+5 V	+12.5 V
Read (Note 3)	L/H	H			

### Notes:

- (1) When +12.5 V is applied to  $V_{PP}$  and +6 V is applied to  $V_{DD}$ , both  $\overline{CE}$  and  $\overline{OE}$  must not be set to the low level (L) simultaneously.
- (2) Data is output from the  $D_0 - D_7$  pins.
- (3)  $D_0 - D_7$  are high impedance

## Recommended Conditions for Unused Pins

Table 3 describes how to set unused pins when programming the PROM.

**Table 3. Recommended Conditions for Unused Pins**

Pin	Recommended Connection
$P0_0 - P0_3$	Connect to $V_{SS}$
$P0_4, P0_5$	Open
$P2_0 - P2_3$	Connect to $V_{SS}$
$P2_5 - P2_7, RFSH$	Open
$P3_0 - P3_3, X1$	Connect to $V_{SS}$
X2	Open
$AN0-AN3, AV_{REF}, AV_{SS}$	Connect to $V_{SS}$
$P3_4 - P3_7, P5_5 - P5_7, \overline{RD}, \overline{WR}, ALE$	Open

## PROM Write Procedure

Data can be written to the PROM by using the following procedure.

- (1) Set the pins not used for programming as indicated in table 3, and supply +6 V to the  $V_{DD}$  pin, and +12.5 V to the  $V_{PP}$  and PROG pins.
- (2) Provide the initial address.
- (3) Provide write data.
- (4) Provide a 1 ms program pulse (active low) to the  $\overline{CE}$  pin.

- (5) Use the verify mode to test the data. If the data has been written, proceed to (7), if not, repeat steps (3) to (5). If the data cannot be correctly written in 25 attempts, go to step (6).
- (6) Classify the PROM as defective and cease write operation.
- (7) Provide write data and supply program pulse (for additional writing) for 3 ms times the number of repeats performed between steps (3) to (5).
- (8) Increment the address.
- (9) Repeat steps (3) to (8) until the last address is reached.

## PROM Read Procedure

The contents of the PROM can be read out to the external data bus  $D_0 - D_7$  by using the following procedure.

- (1) Set the unused pins as indicated in table 3.
- (2) Supply +5 V to the  $V_{DD}$  pin and  $V_{PP}$  pin, and +12.5 V to the PROG pin.
- (3) Input the address of the data to be read to the  $A_0$  to  $A_{12}$  pins.
- (4) Put an active low pulse of at least 1  $\mu$ s on the  $\overline{OE}$  pin.
- (5) Data is output to the  $D_0$  to  $D_7$  pins.

## Erase

The UVE EPROM can be erased by exposing the window to light having a wavelength shorter than 400 nm, including ultraviolet rays, direct sunlight, and fluorescent light. To prevent unintentional erasure, mask the window.

Typically, data is erased by 254-nm ultraviolet rays. A minimum lighting level of 15 W s/cm<sup>2</sup> (ultraviolet ray intensity x exposure time) is required to completely erase written data. Erasure by an ultraviolet lamp rated at 12,000  $\mu$ W/cm<sup>2</sup> takes approximately 15 to 20 minutes. Remove any filter on the lamp and place the device within 2.5 cm of the lamp tubes.

PROM Read Mode Timing

**μPD78312A Family****NEC****INSTRUCTION SET**

The μPD78312A family instruction set features 8- and 16-bit data transfer, arithmetic, and logic instructions and single-bit manipulation instructions. String manipulation instructions are also included. Branch instructions exist to test individual bits in the program status word, the 16-bit accumulator, the special function registers, and the saddr portion of on-chip RAM. Instructions range in length from 1 to 6 bytes depending on the instruction and addressing mode.

**Flag Column Indicators**

Symbol	Action
(blank)	No change
0	Set to 0
1	Set to 1
X	Set or cleared according to result
P	P/V indicates parity of result
V	P/V indicates arithmetic overflow
R	Restored from saved PSW

**Instruction Set Symbols**

Symbol	Definition
r	R0, R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11, R12, R13, R14, R15
r1	R0, R1, R2, R3, R4, R5, R6, R7
r2	C, B
rp	RP0, RP1, RP2, RP3, RP4, RP5, RP6, RP7*
rp1	RP0, RP1, RP2, RP3, RP4, RP5, RP6, RP7*
rp2	DE, HL, VP, UP
sfr	Special function register, 8 bits
sfrp	Special function register, 16 bits
post	RP0, RP1, RP2, RP3, RP4, RP5/PSW, RP6, RP7 Bits set to 1 indicate register pairs to be pushed/popped to/from stack; RP5 pushed/popped by PUSH/POP, SP is stack pointer, PSW pushed/popped by PUSHU/POPU, RP5 is stack pointer.
mem	Register indirect: [DE], [HL], [DE+], [HL+], [DE-], [HL-], [VP], [UP] Base Index Mode: [DE+A], [HL+A], [DE+B], [HL+B], [VP+DE], [VP+HL] Base Mode: [DE+ byte], [HL+ byte], [VP+ byte], [UP+ byte], [SP+ byte] Index Mode word [A], word [B], word [DE], word [HL]
saddr	FE20-FF1FH: Immediate byte addresses one byte in RAM, or label
saddrp	FE20-FF1FH: Immediate byte (bit 0 = 0) addresses one word in RAM, or label

**Instruction Set Symbols (cont)**

Symbol	Definition
word	16 bits of immediate data or label
byte	8 bits of immediate data or label
jdisp8	8-bit two's complement displacement (immediate data displacement value -128 to +127)
bit	3 bits of immediate data (bit position in byte), or label
n	3 bits of immediate data
!addr16	16-bit absolute address specified by an immediate address or label
\$addr16	Relative branch address or label
addr16	16-bit address
!addr11	11-bit immediate address or label
addr11	0800H-0FFFH: 0800H + (11-bit immediate address), or label
addr5	0040H-007EH: 0040H + 2 X (5-bit immediate address), or label
A	A register (8-bit accumulator)
X	X register
B	B register
C	C register
D	D register
E	E register
H	H register
L	L register
R0-R15	Register 0 to register 15
AX	Register pair AX (16-bit accumulator)
BC	Register pair BC
DE	Register pair DE
HL	Register pair HL
RP0-RP7	Register pair 0 to register pair 7
PC	Program counter
SP	Stack pointer
UP	User stack pointer (RP5)
PSW	Program status word
PSWH	High-order 8 bits of PSW
PSWL	Low-order 8 bits of PSW
CY	Carry flag
AC	Auxiliary carry flag
Z	Zero flag
P/V	Parity/overflow flag
S	Sign flag
TPF	Table position flag

### Instruction Set Symbols (cont)

Symbol	Definition
RBS	Register bank select flag
RSS	Register set select flag
IE	Interrupt enable flag
STBC	Standby control register
WDM	Watchdog timer mode register
( )	Contents of the location whose address is within parentheses, (+) and (-) indicate that the address is incremented after or decremented after it is used
(( ))	Contents of the memory location defined by the quantity within the sets of parentheses
xxH	Hexadecimal quantity
X <sub>H</sub> , X <sub>L</sub>	High-order 8 bits and low-order 8 bits of X

\* rp and rp1 describe the same registers but generate different machine code.

**Notes:**

- (1) One byte move instruction when [DE], [HL], [DE+], [DE-], [HL+], or [HL-] is specified for mem.
- (2) rpp refers to register pairs specified in post byte. "n" is the number of register pairs specified in post byte.
- (3) Either of the two mnemonics may be used
