## competitive update

Published monthly, Competitive Update is the official Corporate publication to communicate information regarding major competitor's products and related Digital products.

## distribution

The readership of Competitive Update comprises PAC/MSSC members, Sales, Software, Field Service, Headquarters, Order Administration, Literature Contacts and other exempt personnel. Employees must submit their request to Carolyn Smith via memo (OG01-1/U06), RCS message (CSCG) or EMS (SALES UPDATE), stating name, badge number, job code, job title, cost center and location.

## change of address

Notification of address changes should be directed to the employee's Personnel Representative or PSA, for incorporation on the individual's Employee Profile form. Processing of this information is accomplished only through the Personnel Department.

## administration

Competitive Update is published by CORPORATE SALES COMMUNICATIONS, OGO1-1/UO6, STOW, and is printed and distributed by Digital's Publishing and Circulation Services in Northboro. Cover design by CORPORATE SALES COMMUNICATIONS CREATIVE VISUAL ARTS DEPARTMENT.

$$

The spectacular success of VAXclusters and the threat of VAXclustered 8600 s positioned against IBM's 308X family appears to have resulted in a major IBM campaign to discredit the viability of VAXclusters. Prior to the introduction of the VAX 8600 , $I B M$ sales reps were calling VAXclusters a short-term product designed to cover our inability to get high-end machines to market. Now we have been assailed by several derogatory articles in publications which are widely read in the $I B M$ mainframe community proclaiming that it is inappropriate to speak of VAXclustered 8600 s as competitors to IBM's 308X family of large-scale systems. What have we done to IBM and its followers that they feel compelled to spew forth so much vaxcluster-inspired negative rhetoric?

Simply put, the introduction of VAXclustered 8600 s has placed an excellent interactive computing environment in the heart of IBM's bread-and-butter, batch-oriented mainframe markets. Far from being a short-term product, VAXclusters are the result of major engineering investments in interconnect technology made over the last ten years. This technology has been widely accepted by our customers and we have installed over 1,500 vaxclusters.

VAXclustered 8600 s have positioned us as a full-range information-processing vendor. We now offer an alternative, interactive style of computing to IBM's 20-year old $S / 360 / 370$ batch architecture; and we have done this at a critical period in the evolution of $I B^{\prime} M^{\prime}$ s installed mainframe base - critical for many reasons.

## THE IBM MAINFRAME BASE

First, despite all of IBM's promotion of the "Information Center" concept as a means for the central DP shop to provide application development relief to the end user, the backlog of applications waiting to be developed in Fortune-500 companies stands at an all-time high. End users have to wait years for new programs and systems to be implemented. At a time when access to corporate information is the competitive edge many companies need, IBM has yet to deliver the style of computing required to effectively accomplish this on their mainframe systems. Approximately $70 \%-80 \%$ of the processing done by these systems is still batch.

Second, many companies are moving to decentralize their organizational structures. This is being done to push down decision-making responsibility to line managers and reduce corporate staffs. As a result, data processing functions are also being decentralized. These companies have, over the years, climbed the ladder of $I B^{\prime} s$ largely incompatible mainframe operating systems (DOS/VS to VSl to VS2 to MVS to MVS/XA). Each step up this ladder has increased their system support staffs andincurred a great deal of conversion expense.

However, since $I B M^{\prime} s$ large mainframe commercial operating system does not run on small to mid-range 4300 CPUs, these companies are now faced with supporting multiple $0 / S$ environments to implement their corporate decentralization strategies. This means duplicate application development and, more significantly, duplicate software maintenance. These lead to escalating application development costs and even larger application backlogs.

Third, there are strong indications that the system/38 is their next mainframe architecture and users of low to mid-range 4300 s running the DOS/VSE operating system would be "encouraged" to migrate to System/38 over the next few years. Clearly, migration to System/38 will represent yet another, and very major, conversion expense for these IBM customers.

Certainly the very existence of the System/38 family, which with the recent addition of the Models 20 and 40 covers much of the 4300 space, is a defacto admission of the failure of the 4300 to provide an acceptable distributed solution for many customers. One can only wonder what level of commitment IBM will retain for even its high-end operating system environment as System/38 moves up the performance ramp.

Fourth, the extraordinary success of the IBM Personal Computer, which delivered interactive computing directly to the desktop, has fueled an end-user revolt in many large companies. As PCs have proliferated, the central DP shops have recognized this inherent threat to their dominance and have moved to place strict controls on PC acquisition. This situation has been aggravated by the fundamental incompatibility of the PC with IBM's mainframe offerings (ASCII vs. EBCDIC). This makes interoperability expensive and cumbersome.

Fifth, at a time when local area networks are being installed by many large companies as means to support the $P C$ explosion and the move to interactive processing, $I B M$ has indicated that its own proprietary LAN will not be fully available for another two-to-three years. Even then it may not be worth waiting for. Several distributors and customers have complained publicly about the price and quality of the cabling system components (reference Communications Week dated December 31, 1984, page 1).

Sixth, IBM's aggressive behavior vis-a-vis the vendors of IBM plugcompatible mainframes, personal computers and peripherals raises the specter of total IBM account dominance in the mainframe arena. The PCM vendors have acted as the "invisible hand" of the marketplace -- competition. As these vendors continue to withdraw from selling plug-compatible gear, there will be less and less incentive for IBM to continue to maintain current rates of pricel performance improvement. Those accounts following a single-vendor strategy may well be faced with paying more for less.

We bring to these IBM customers a family of systems -- from MicrovaX $I$ to VAXclustered 8600 s - which offers a compatible range of information processing capacity unavailable from $I B M$. We provide the ideal solution for the implementation of corporate information processing decentralization strategies. We are totally committed to the VAX architecture and the VMS application environment, and that means no more conversions for users who adopt our style of computing. The IBM PC is more compatible with our products than with IBM's and we are delivering Ethernet products, an industry standard, today. At a time when it makes sense economically to embrace a dual-vendor strategy to support information processing objectives, we are the alternative to IBM.

Considering all this, is it little wonder that we have been the target of so much negative rhetoric?

## MEETING INFORMATION PROCESSING GROWTH DEMAND

A key strength of our VAXcluster style of computing is cost-effective incremental growth. This provides significant growth options beyond those previously available with "DEC-networked" systems. We will now assess how we better serve the fast-growing information processing needs of today's decentralized organizations.

The following analysis is based on a CPU capacity growth of approximately 40\% compounded annually (the growth rate of IBM mainframe installed-base MIPS). Initially, it is assumed that about two VAX 8600 worth of CPU capacity is installed. The target configurations for a five-year growth period are:

| Year | $\begin{gathered} \text { Capacity } \\ \text { X } 8600 \end{gathered}$ | $\begin{gathered} \mathrm{Aggr} \\ \mathrm{MB} \\ \hline \end{gathered}$ | Terminals | Disk GB | $\begin{gathered} 125 \text { IPS } \\ \text { Tapes } \\ \hline \end{gathered}$ | $\begin{aligned} & 1200 \mathrm{LPM} \\ & \text { Printers } \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 2 | 24 | 512 | 20.0 | 3 | 2 |
| 2 | 3 | 48 | 768 | 22.5 | 3 | 3 |
| 3 | 4 | 64 | 1024 | 25.0 | 3 | 4 |
| 4 | 6 | 96 | 1536 | 30.0 | 4 | 6 |
| 5 | 8 | 132 | 2048 | 40.0 | 6 | 8 |

Two growth scenarios are constructed following the above configuration guidelines:
(1) A VAXcluster is incrementally expanded by adding VAX 8600 processors.
(2) An $I B M$ 308X mainframe system running the MVS/XA operating system is field upgraded to meet the yearly capacity growth demands.

FOR INTERNAL USE ONLY

The following tables sumarize the cumulative yearly costs (rounded to nearest $\$ 1,000$ ) of both growth scenarios. All configuration details are provided in the attached appendices:

| VAXcluster | 1 | 2 | Year 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| H/W Purchase | \$2,820K | \$3,973K | \$5,079K | \$7,231K | \$9,653K |
| H/W Maintenance | 200K | 547 K | 998 K | 1,629K | 2,485K |
| S/W Licenses | 71 K | 100K | 129 K | 185K | 240K |
| S/W Maintenance | 55 K | 89K | 128K | 174 K | 230K |
| Total | \$3,146K | \$4,709K | \$6,333K | \$9,219K \$ | \$12,607K |
| IBM Mainframe | 1 | 2 | Year | 4 | 5 |
| H/W Purchase | \$5,214K | \$7,823K | \$9,433K | \$15,481K | K \$17,633K |
| H/W Maintenance | 141 K | 440K | 839 K | 1,398K | K $2,198 \mathrm{~K}$ |
| S/W Licenses | 70K | 70K | 70K | 70K | K 70K |
| S/W Maintenance | 22 K | 469 K | 716 K | 975 K | K 1,234K |
| Total | \$5,648K | \$8,802K | \$11,059K | \$17,924K | K $21,137 \mathrm{~K}$ |

Following the stated growth requirements, the five-year sum of costs of the IBM mainframe approach is $68 \%$ more ( $\$ 8.5$ million more) than the VAXcluster solution. A five-year cost-of-ownership analysis of these two growth scenarios (taking into account the cost of capital, investment tax credits, marginal tax rate, salvage value and using the 5-year ACRS depreciation method) reveals that the $I B M$ mainframe would cost the customer $76 \%$ more than the VAXcluster solution ( $\$ 5.8$ versus $\$ 10.3$ million)!

## Other Support Costs

It is important to note that no user support personnel costs are included in this analysis to avoid blurring pure vendor product cost comparisons. In reality, the $I B M$ mainframe software support personnel costs would be at least five times that of the VAXcluster. If the VAXcluster required two people, the $I B M$ mainframe would need at least ten -- assuming burdened annual labor rate of $\$ 60,000$ per person would add $\$ 120,000 / y e a r$ to VAXcluster operating costs while increasing yearly IBM mainframe costs by \$600,000!

## FOR INTERNAL USE ONLY

## COMPUTER ROOM REQUIREMENTS

In addition to the financial aspects of acquisition and maintenance are the computer room requirements of the selected system. The following analysis illustrates the cumulative five-year computer room environmental needs of both the VAXcluster and the $I B M$ mainframe. Air conditioning capacity is represented by the number of kBTUs (British Thermal Units X 1,000 ) per hour and power consumption is given in kVA (Volt-Amps $X$ 1,000) per hour. Two figures appear for floorspace. Footprint is the area (in square feet) covered by just the hardware. Computer room area (CR Area) is the space needed for installed hardware, including required service clearances:

| VAXcluster | 1 | 2 | $\begin{gathered} \text { Year } \\ 3 \end{gathered}$ | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| kBTUs | 187 | 231 | 272 | 362 | 485 |
| kVAs | 66 | 79 | 92 | 121 | 162 |
| Footprint Sq Ft | 166 | 206 | 242 | 323 | 431 |
| CR Area Sq Ft | 596 | 722 | 831 | 1,078 | 1,376 |
|  |  |  | Year |  |  |
| IBM Mainframe | 1 | 2 | 3 | 4 | 5 |
| kBTUs | 215 | 239 | 288 | 492 | 541 |
| kVAs | 69 | 83 | 94 | 161 | 180 |
| Footprint Sq Ft | 271 | 300 | 327 | 523 | 583 |
| CR Area Sq Ft | 1,068 | 1,158 | 1,309 | 1,953 | 2,137 |

Across the board, the VAXcluster's computer room requirements are less than IBM's mainframe. At a time when computer room space is at a premium in most large companies, the IBM mainframe requires $55 \%$ more floorspace!

## SUMMARY

VAXclusters are delivering exceptional interactive capabilities and unique growth opportunities TODAY which IBM has yet to provide their S/360/370 mainframe customers. The introduction of VAXclustered 8600 s has positioned us as a full-range information processing vendor and an alternate to IBM at a critical period in the evolution of $I B M^{\prime} s$ mainframe base. Large companies implementing corporate decentralization strategies will find the VAX architecture and the VMS application environment the ideal computing style to support their objectives.

However, we are not in the 308 X "replacement business." This has been the unsuccessful strategy of the "BUNCH" companies -- we are different and unique. VAXclustered 8600 s remove a key competitive advantage that IBM has always had against us -- upward growth capability. For new application areas we now offer a wider family of compatible systems than IBM.

Spread the word and good selling!

## SUMMARIES

Appendix A Notes:
This appendix contains summary data which is extracted from the detailed configurations found in Appendix $B$ and the computer room layouts in Appendix C. Page 8 presents five-year incremental and cumulative costs and computer room requirements for both the VAXcluster and the IBM mainframe. The rows starting with "lst Year" represent the first year costs associated with each individual year's hardware and software upgrades. It adjusts for any warranty allowances applicable to these items.

Page 9 is an analysis, by mar component, of thefive-year cumulative costs. The component costs are presented for both the VAXcluster and the IBM mainframe, the difference is calculated ("DEC-IBM" table) and the delta percent is generated ("(DEC-IBM)/IBM" table). Finally, a component distribution is provided to illustrate how costs are distributed within a given configuration growth scenario.

Pages 10 and 11 present a cost of ownership analysis for both scenarios. The only difference between pages 10 and 11 is that page 10 assumes a $20 \%$ hardware salvage value whereas page ll assumes no hardware salvage value. Both five-year and ten-year costs of ownership are calculated. The ten-year cost of ownership assumes hardware and software maintenance fees remain at year-five levels and that no additional software license fees are incurred.

## DETAILED CONFIGURATIONS

Appendix $B$ Notes:
This appendix contains the detailed configuration pricing information for the five-year growth scenarios. Each yearly price sheet depicts the upgrade costs for that year only. Refer to Appendix for cumulative cost rollups. All applicable volume discounts have been applied and are shown in the yearly price sheets. Please note that IBM's "Volume Purchase Agreement" covers an 18 -month period as compared to our own one-year time span. For this analysis three VPA periods are used: years 1 plus 2, 3 plus 4, and year 5 .

## HIGH AVAILABILITY

To the extent feasible, the configurations represent high-availability interactive computing environments. All critical vaxcluster controling hardware components have backup units, as have most of the IBM mainframe hardware (note: disks were not duplicated). Important exceptions in the year 1 IBM configuration are the 3083 CPU and the 3082 Processor Controller. The failure of either of these components would make the entire configuration unavailable. In years 2 and 3 a failure in the single 3082 would also make the entire configuration unavailable. Only in years 4 and 5 , where the 3084 four-processor system requires duplicate 3082 s , would this single point of failure be eliminated.

Refer to pages 16 and 17 for year 1 component interconnection schematics for the VAXcluster and the $I B M$ mainframe.

## CPUs

Please note that the year 2 IBM mainframe configuration contains compute capacity above that required by the configuration guidelines. A 3081-GX would have provided about the right compute power; however, IBM does not allow upgrades from the $3083-J X$ to the $3081-G X$. The configured $3081-K X$ is the only upgrade allowed.

Also note that the year $43084-Q X$ has more memory than is required by the configuration guidelines. IBM only supports "symmetrical" memory upgrades to the 3084. This forced the 3084 upgrade to the 132 MB level.

FOR INTERNAL USE ONLY

## TERMINAL CONFIGURATION

The configurations assume the following terminal population distribution:

|  | 1 | 2 | $\begin{array}{r} \text { Year } \\ 3 \end{array}$ | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Local | 416 | 576 | 736 | 1,056 | 1,376 |
| Remote: |  |  |  |  |  |
| Single Term | 16 | 32 | 48 | 80 | 112 |
| 4 Term Group | 32 | 64 | 96 | 160 | 224 |
| 8 Term Group | 32 | 64 | 96 | 160 | 224 |
| 16 Term Group | 16 | 32 | 48 | 80 | 112 |
| Total | 512 | 768 | 1,024 | 1,536 | 2,048 |

VAXcluster local terminals are on Ethernet Terminal Servers [please note that as this article goes to press the VAX 8600 Terminal Server software license prices have not been finalized; estimated pricing has been used in the detailed configurations]. Backup local terminal access is a standard feature of the Terminal Server. All H4000 Ethernet Transceivers are included in the price sheets. Remote terminal access is through dial-in DMZ32 lines. Single terminals utilize DF03-AA 1200/300 Baud Modems. Remote terminals in groups of 4 are attached to DFMO4-AB Statistical Multiplexers with integral 4800 baud modems. Remote groups of 8 terminals attach to DFMO8-AB Statistical Multiplexers with integral 4800 baud modems. Remote groups of 16 terminals utilize the DFMl6-AB. VAXcluster backup remote access cabability is provided by including enough additional spare DMZ32 lines, multiplexers and modems to cover the outage of any single VAX 8600 . All modems and multiplexers (both host-side and remote) are included in the pricing sheets.

IBM mainframe local terminals attach through 3299-001 Terminal Multiplexers to 3274-41C channel-attached Terminal Controllers. Backup local terminal access is provided by $3814-\mathrm{A} 01$ Control Unit switches (note: this is a manual failover initiated by computer room personnel -- the Ethernet Terminal Server provides this function automatically). Remote access for single, groups of 4 and groups of 8 terminals is provided by the 3276-012 Control Unit Display Station (allows up to 8 clustered terminals to be attached). Remote groups of 16 terminals are attached to 3274-61C communcating Terminal Controllers. Host-side remote access capability is provided by multiple 3725-00l Communications Controllers. IBM mainframe backup remote access capability is provided by including enough additional spare 3725 lines and modems to cover the failure of any single 3725 .

## TAPE DRIVES

Enough tape drives have been configured to support the backup of the entire disk configuration in about four hours.

FOR INTERNAL USE ONLY

```
PRINTERS
Equivalent printing capacity in lines per minute (LPM) are configured.
HARDWARE SERVICES
DECservice pricing has been used for all Digital hardware components.
SOFTWARE
Software has been included to provide a reasonable interactive computing
environment with communications, relational data management, database query,
transaction processing and two languages (FORTRAN and COBOL).
SOFTWARE SERVICES
The VAXcuster includes full DECsupport and System Start Service (Level III).
```

## COMPUTER ROOM LAYOUTS

## Appendix C Notes:

This appendix contains pictorial representations of the computer rom layouts for the five-year growth scenarios. Although orginally drawn to scale, duplication for publication may distort some dimensions. Areal calculations were made from measurements taken on the original, to scale, drawings. The original layouts were done using a scale of 3/16" equal to $l^{\prime}$. The purpose of creating actual computer room layouts is to allow for service clearance overlaps between the various hardware components installed.

For the VAXcluster it was assumed that communications multiplexers and modems would not be located in the computer room proper but rather in a separate communications room. A similar assumption was made for the IBM mainframe in that modems and locally attached 3274 terminal controllers would be located outside the computer room.

The $I B M$ mainframe was positioned using the minimum 308 X CPU to 3082 Processor Controller clearances allowed. The relational positioning of these two hardware items is predefined by IBM and not at the discretion of the computer room designer.
