# HP64000 <br> Logic Development System 

Model 64941A Flexible Disc (Floppy) Drive Controller

## CERTIFICATION

Hewlett-Packard Company certifies that this product met its published specifications at the time of shipment from the factory. Hewlett-Packard further certifies that its calibration measurements are traceable to the United States National Bureau of Standards, to the extent allowed by the Bureau's calibration facility, and to the calibration facilities of other International Standards Organization members.

## W ARRANTY

This Hewlett-Packard system product is warranted against defects in materials and workmanship for a period of 90 days from date of installation. During the warranty period, HP will, at its options, either repair or replace products which prove to be defective.

Warranty service of this product will be performed at Buyer's facility at no charge within HP service travel areas. Outside HP service travel areas, warranty service will be performed at Buyer's facility only upon HP's prior agreement and Buyer shall pay HP's round trip travel expenses. In all other cases, products must be returned to a service facility designated by HP.

For products returned to HP for warranty service, Buyer shall prepay shipping charges to HP and HP shall pay shipping charges to return the product to Buyer. However, Buyer shall pay all shipping charges, duties, and taxes for products returned to HP from another country.

HP warrants that its software and firmware designated by HP for use with an instrument will execute its programming instructions when properly installed on that instrument. HP does not warrant that the operation of the instrument, or software, or firmware will be uninterrupted or error free.

## LIMITATION OF WARRANTY

The foregoing warranty shall not apply to defects resulting from improper or inadequate maintenance by Buyer, Buyer-supplied software or interfacing, unauthorized modification or misuse, operation outside the environmental specifications for the product, or improper site preparation or maintenance.

NO OTHER WARRANTY IS EXPRESSED OR IMPLIED. HP SPECIFICALLY DISCLAIMS THE IMPLIED WARRANTIES OF MERCHANTIBILITY AND FITNESS FOR A PARTICULAR PURPOSE.

## EXCLUSIVE REMEDIES

THE REMEDIES PROVIDED HEREIN ARE BUYER'S SOLE AND EXCLUSIVE REMEDIES. HP SHALL NOT BE LIABLE FOR ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES, WHETHER BASED ON CONTRACT, TORT, OR ANY OTHER LEGAL THEORY.

[^0]POSTAGE WILL BE PAID BY ADDRESSEE

## READER COMMENT SHEET

Service Manual, Model 64941A
Flexible Disc (Floppy) Drive Controller 64941-90902, April 1983

Your comments are important to us. Please answer this questionaire and return it to us. Circle the number that best describes your answer in questions 1 through 7. Thank you.

1. The information in this book is complete:

| Doesn't cover enough <br> what more do you need?) | 1 | 2 | 3 | 4 | 5 |
| :---: | :--- | :--- | :--- | :--- | :--- |$\quad$ Covers everything

2. The information in this book is accurate:
Too many errors
12345
Exactly right
3. The information in this book is easy to find:

I can't find things I need | 1 | 2 | 3 | 4 | 5 |
| :--- | :--- | :--- | :--- | :--- |

4. The Index and Table of Contents are useful:

Helpful
12345
Missing or inadequate
5. What about the "how-to" procedures and examples:

| No help | 1 | 2 | 3 | 4 | 5 | Very helpful |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Too many now | 1 | 2 | 3 | 4 | 5 | l'd like more |

6. What about the writing style:

$$
\begin{array}{llllll}
\text { Confusing } & 1 & 2 & 3 & 4 & 5
\end{array}
$$

Clear
7. What about organization of the book:

Poor order
$1 \begin{array}{llll}1 & 2 & 3 & 5\end{array}$
Good order
8. What about the size of the book:
too big/small
12345
Right size

SERVICE MANUAL

## MODEL 64941A FLEXIBLE DISC DRIVE

## REPAIR NUMBERS

This manual applies to 64941 A Flexible Disc Drive with a repair number prefix of 2429 A . For further information on repair numbers refer to "Instruments Covered by This Manual" in Section I.

## © COPYRIGHT HEWLETT -PACKARD COMPANY 1982,1983 LOGIC SYSTEMS DIVISION COLORADO SPRINGS, COLORADO, U.S.A.

ALL RIGHTS RESERVED

Manual Part No. 64941-90902
PRINTED: APRIL 1983
UPDATED: JULY 1984

## SAFETY SUMMARY

The following general safety precautions must be observed during all phases of operation, service, and repair of this instrument. Failure to comply with these precautions or with specific warnings elsewhere in this manual violates safety standards of design, manufacture, and intended use of the instrument. Hewlett-Packard Company assumes no liability for the customer's failure to comply with these requirements.

## GROUND THE INSTRUMENT.

To minimize shock hazard, the instrument chassis and cabinet must be connected to an electrical ground. The instrument is equipped with a three-conductor ac power cable. The power cable must either be plugged into an approved three-contact electrical outlet or used with a three-contact to two-contact adapter with the grounding wire (green) firmly connected to an electrical ground (safety ground) at the power outlet. The power jack and mating plug of the power cable meet International Electrotechnical Commission (IEC) safety standards.

## DO NOT OPERATE IN AN EXPLOSIVE ATMOSPHERE.

Do not operate the instrument in the presence of flammable gases or fumes. Operation of any electrical instrument in such an environment constitutes a definite safety hazard.

## KEEP AWAY FROM LIVE CIRCUITS.

Operating personnel must not remove instrument covers. Component replacement and internal adjustments must be made by qualified maintenance personnel. Do not replace components with the power cable connected. Under certain conditions, dangerous voltages may exist even with the power cable removed. To avoid injuries, always disconnect power and discharge circuits before touching them.

## DO NOT SERVICE OR ADJUST ALONE.

Do not attempt internal service or adjustment unless another person, capable of rendering first aid and resuscitation, is present.

## do Not substitute parts Or modify instrument.

Because of the danger of introducing additional hazards, do not install substitute parts or perform any unauthorized modification of the instrument. Return the instrument to a Hewlett-Packard Sales and Service Office for service and repair to ensure that safety features are maintained.

## DANGEROUS PROCEDURE WARNINGS.

Warnings, such as the example below, precede potentially dangerous procedures throughout this manual. Instructions contained in the warnings must be followed.

## WARNING

Dangerous voltages, capable of causing death, are present in this instrument. Use extreme caution when handling, testing, and adjusting.

## SECTION I

## GENERAL INFORMATION

1-1. INTRODUCTION.

1-2. This manual contains information and theory necessary to operate, install, maintain, and troubleshoot the Floppy Disc Drive option. Operating instructions are provided in a separate operating manual supplied with the instrument. It should be kept with the instrument for use by the operator.

## 1-3. INSTRUMENTS COVERED BY THIS MANUAL.

1-4. Attached to the instrument or printed on the printed circuit board is the repair number. The repair number is in the form 0000A0000. It is in two parts; the first four digits and the letter are the repair prefix, and the last five are the suffix. The prefix is the same for all identical instruments. The suffix, however, is assigned sequentially and is different for each instrument. The contents of this manual apply to instruments with the repair number prefix(es) listed under REPAIR NUMBERS on the title page.

1-5. An instrument manufactured after the printing of this manual may have a repair number prefix that is not listed on the title page. This unlisted repair number prefix indicates that the instrument is different than those described in this manual. The manual for this newer instrument is accompanied by a Manual Changes supplement. This supplement contains "change information" that explains how to adapt the manual for the newer instrument.

1-6. In addition to change information, the supplement contains information for correcting errors in the manual. To keep this manual as current as possible, Hewlett-Packard recommends that you periodically request the latest Manual Changes supplement. The supplement for this manual is identified with the manual print date and part number, both of which appear on the manual title page.

1-7. For information concerning a repair number prefix that is not listed on the title page or in the Manual Changes supplement, contact your nearest Hewlett-Packard Sales/Service Office.

1-8. SAFETY CONSIDERATIONS.

1-9. The Local Mass Storage unit is installed in a 64100A Mainframe (see figure 1-1) and contains voltages in +-12 V AND +5 V range.

1-10. There are high voltages present in the mainframe. Exercise EXTREME CAUTION when removing or installing the Flexible Disc Drive(s). Lethal Voltages exist under the high voltage cover and around the CRT. Review the Mainframe Service Manual for WARNINGs and CAUTIONs before servicing.

1-11. PHYSICAL DESCRIPTION.

1-12. Each Mini Flexible Disc Drive is a semi-random access mass storage system employing a flexible magnetic medium. It consists of a Mini Disc Drive, a Servo Electronics circuit board, a Drive Electronics circuit board, and a Mini Control board.

1-13. Each drive module contains all the mechanical parts necessary for physically handling the disc. These include the drive spindle and motor, 2 heads each having read/write and erase capability, write protect sensor, track 0 sensor, index sensor, and activity LED on the front panel. Each drive module also contains a Servo Control board which controls the DC drive motor speed and a Drive Electronics board which interprets and generates control signals, controls movement of the read/write head to the correct position, and also reads and writes data.

1-14. The flexible magnetic medium used for Local Mass Storage is called a flexible disc. A disc measures 133.4 mm ( 5.25 inches) on a side and has a 3.8 cm ( 1.5 inch) hole for alignment on the disc drive spindle. The disc is enclosed in a protective polyvinylchloride (PVC) jacket with a slot for access to the recording surface. Both sides of the flexible disc are used for data storage.

1-15. The recording head in the drive module is positioned by a mechanism driven by a stepper motor and taut metal band. The head positioning mechanism operates in an open loop configuration, that is, there is no feedback to the Drive Electronics board to determine the actual position of the head.

1-16. The heads are mechanically coupled to the door mechanism so that closing of the door (pushing down the latch) causes the heads to make contact with the media.

## 1-17. ENVIRONMENTAL AND PHYSICAL SPECIFICATIONS.

1-18. OPERATING ENVIRONMENT.

1-19. The Flexible Disc Drive Local Mass Storage unit may be operated in environments within the following limits:
a. Temperature: $+10^{*} \mathrm{C}$ to $+44^{*} \mathrm{C}$ (50*F to $111.2^{*} \mathrm{~F}$ )
b. Relative Humidity: $20 \%$ to $80 \%$ while at +29.4 C ( 85 F )
c. Altitude: 0 to 4572 m ( 0 to 15000 ft )

It should be protected from temperature extremes which cause condensation within the instrument.

1-20. STORAGE ENVIRONMENT.

1-21. The Flexible Disc Drive Local Mass Storage may be stored or shipped in environments within the following limits:
a. Temperature: $-41^{\circ} \mathrm{C}$ to $+71^{\circ} \mathrm{C} \quad\left(-40.5^{\circ} \mathrm{F}\right.$ to $\left.+159.8^{\circ} \mathrm{F}\right)$
b. Relative Humidity: $20 \%$ to $80 \%$ at $+29.4^{\circ} \mathrm{C} \quad\left(+85^{\circ} \mathrm{F}\right)$
c. Altitude: 0 to 4572 m ( 0 to 15000 feet)

1-22. RECORDING CHARACTERISTICS.

1-23. HP PHYSICAL TRACK FORMAT.
a. Recording Mode: Modified Frequency Modulated (MFM)
b. Rotational Speed: 300 RPM +-1.5\% (+-4.5 RPM)
c. Bit Density: 5456 BPI on Track 34
d. Tracks Per Inch: 48
e. Sides Per Disc: 2
f. Tracks Per Sides: 35
g. Sectors Per Track: 16
h. Bytes Per Sector: 256 ( 362 including overhead bytes)
i. Bytes Per Disc: 286,720 (formatted) 420,000 (unformatted)

1-24. ALIGNMENT LIMITS.
a. Radial Alignment: 1.1 mils maximum of track center at track 16 measured at $20^{\circ} \mathrm{C}\left(68^{\circ} \mathrm{F}\right)$ and $50 \%$ humidity.
b. Azimuth: 18 degrees maximum clockwise/counterclockwise on tracks 16 and 34.

1-25. PHYSICAL DIMENSIONS.

1-26. Figure 1-2 illustrates the physical dimensions of a single flexible disc drive unit.

1-27. POWER REQUIREMENTS.

1-28. Table 1-1 gives the power requirements for a single or double flexible disc drive plus a Mini Control board. The values include the $O N$ transient which is considered to be the most limiting case.

Table 1-1. Power Requirements

| Total (1) Drive | +5 V current use $=1.7 \mathrm{~A}-1.8 \mathrm{~A}$ During PV |
| :--- | :--- |
| Total (2) drives $\quad+5 \mathrm{~V}$ current use $=3.4 \mathrm{~A}-3.6 \mathrm{~A}$ During PV |  |

1-29. MINI DRIVE ASSEMBLIES.
1-30. The flexible disc drives used in the 64000 system are HP9130K drives with the following options.

1-31. OPTION \#010. This option consists of drive board $P / N$ 09130-66501. Refer to figure 1-3.

1-32. OPTION \#052. This option consists of the mechanical drive assembly with Servo board and front panel P/N 4040-1915 and brown latch $P / N$ 4040-1913 and associated hardware. Refer to figure 1-3. Inis option also has an exchange assembly number HP P/N 09130-69600.

NOTES:

1. DIMENSIONS GIVEN AS MILLIMETRES (INCHES).
2. THIS DIMENSION FROM BACK OF FACEPLATE.

Figure 1-2. Physical Dimensions

1-33. RECOMMENDED TEST EQUIPMENT.

## SECTION II

## INSTALLATION AND REMOVAL

2-1. INTRODUCTION.
2-2. This section contains information for unpacking, initial inspection, installation and removal of the Local Mass Storage (Mini Flexible Disc Drives and Mini Control board).

2-3. The initial inspection procedure assumes the unit is installed. An installation and removal procedure is included for installing a new unit or removing a defective unit.
a. Unpack the Local Mass Storage unit.
b. Keep the shipping carton and cushioning material until the contents have been checked. The carrier will wish to inspect the shipping materials if a claim is made.
c. Visually inspect the unit for mechanical damage.
d. Install the Mini Drive(s) using the installation procedures in paragraphs 2-4 (Installation of new Mini Drive and Mini Control board Procedure) or paragraph 2-6 (removal and installation for servicing).
e. Run the performance verification tests as specified in this service manual. See section IV for more information.
f. If the contents are not complete, or there is mechanical damage, or defect, or it does not pass the performance verification, then notify the carrier as well as the Hewlett-Packard Field Sales/Service Office. Addresses and numbers are located at the back of this manual. HP will arrange for repair or replacement at HP option without waiting for the claim against the carrier to be settled.

2-4. INSTALLATION OF NEW MINI DRIVE AND MINI CONTROL BOARD PROCEDURE.
2-5. The following procedure should be used when installing a Local Mass Storage unit into a 64100A Mainframe. This procedure assumes that no Local Mass Storage option is installed.
a. Switch power OFF on the mainframe and disconnect the AC power cord.
b. Completely remove the five screws that secure the top cover. Remove the two (or four) Rear-Panel screws holding the state and timing grounding clips. Lift and remove cover.
c. Remove the four display bezel attach screws and washers. See figure 2-1.
d. Pull the display bezel forward.
e. Remove the four screws and washers attaching the blank cover panel. See figure 2-2.
f. Attach the Mini Drive cover panel using the four screws and washers from step (e).
g. Remove the cardboard from inside the drive unit that is protecting the drive heads.
h. Place the Mini Drive cables into and through shield box as shown in figure 2-3.
i. Mount the drive unit(s) into the shield box using the four attach screws provided for each drive.
j. Mount the drive unit onto the display bezel using the four attach screws provided.
k. Plug upper drive 0's keyed power cable P2 into J2 on drive 0 and connect (W1) ribbon control cable P1 onto J1 on drive 0. Make sure that pin one on the plug, indicated by a triangle molded on the connector, is attached to pin one on the jack.

1. Plug lower drive 1's keyed power cable P2 into J2 on drive 1 and connect (W1) ribbon control cable P1 onto J1 on drive 1. Make sure that pin one on the plug, indicated by a triangle molded on the connector, is attached to pin one on the jack.
$m$. Remove the two plug IOD cable from the $C P U$ and I/O board in the card cage. See figure 2-6.
$n$. Insert the Mini Control board into slot 0 in the card cage behind the CPU board.
o. Attach the three plug IOD cable so that the I/O, CPU and Mini Control boards are connected on the I/O bus. See figure 2-6.
p. Attach drive 0's control and power cables P1 and P2 into J4 and J2 on the Mini Control board. Make certain that pin one on the plug is attached to pin one on the Mini Control board jack.
q. Attach drive 1's control and power cables P1 and P2 into J3 and J1 on the Mini Control board. Make certain that pin one on the plug is attached to pin one on the Mini Control board jack.
r. Push the display bezel back enough so the drive cables are lose.
s. Pull the two control cables $W 1$ back and fold. Attach them to the clip on the top of the shield box. See figure 2-6. Note: Make sure that the cables are not lying near the CRT.
t. Push the display bezel all the way back and secure it with the four attach screws and washers.
u. Put on the top cover making sure not to pinch the drive power cables and secure it with the five top cover screws. Attach the state and timing ground clips to the Rear-Panel with the two (or four) screws given.
v. Installation complete.

2-6. MINI DRIVE REMOVAL PROCEDURE.
a. Switch power OFF on the mainframe and disconnect the AC power cord.
b. Completely remove the five screws that secure the top cover. Remove the two (or four) Rear-Panel screws holding the state and timing grounding clips. Lift and remove cover.
c. Disconnect both Mini Drive power and ribbon cables from the Mini Control board.
d. Remove the four display bezel attach screws and washers. See figure 2-1.
e. Pull the display bezel forward.
f. Remove the four screws and washers that attach the shield box to the mainframe. See figure 2-4.
g. Remove the shield box from the mainframe. The Mini Drives are located inside the shield box. There are four screws for upper drive 0 and four screws for lower drive 1 which attach the shield box to each of the drives. Remove the applicable screws. Remove the Mini Drive(s) from the shield box. See figure 2-3 thru 2-5.

NOTE
The power and control cables are routed through the back of the shield box. Use CAUTION when removing the Mini Drive(s). Damage may occur to cables if they are not treated carefully when being pulled through the rear of the shield box.

2-7. MINI DRIVE INSTALLATION PROCEDURE. (After Servicing Drive)
a. Place Mini Drive(s) cables into and through shield box as shown in figure 2-3. Make sure cables are not bent or twisted.
b. Plug upper drive 0 's keyed power cable P2 into J2 on drive 0 and connect (W1) ribbon control cable P1 into J1 on drive 0 . Make sure that pin 1 on the plug, indicated by a triangle molded on the connector, is attached to pin 1 on the jack.
c. Plug lower drive 1's keyed power cable P2 into J2 on drive 1 and connect (W1) ribbon control cable P1 into J1 on drive 0 . Make sure that pin 1 on the plug, indicated by a triangle molded on the connector, is attached to pin 1 on the jack.
d. Attach drive 0 's control and power cables P1 into J4 and P2 into J2 on the Mini Drive Control board. Make certain that pin 1 on the plug is attached to pin 1 on the jack.
e. Attach drive 1 's control and power cables P1 into J4 and P2 into J2 on the Mini Drive Control board. Make certain that pin 1 on the plug is attached to pin 1 on the jack.
f. Attach the four screws that attach each of the Mini Drives to the shield box.
g. Reattach the shield box to the bezel with four screws and washers. See figure 2-5. Be careful not to drop the screws or washers into the mainframe.
h. Pull up the lock bracket on the left side of display bezel and push bezel back into mainframe. See figure 2-1.
i. Fold ribbon cables as shown in figure 2-6. Make SURE the power cables (P2) are away from the CRT.
j. Reattach the four display bezel attach screws and washers. See figure 2-1.
k. Place the top cover on the mainframe and reattach the five attach screws that secure the top cover. Reattach the state grounding clip(s) with the two (or four) attach screws.

## 2-8. MINI DRIVE JUMPER CONFIGURATIONS.

2-9. Each disc drive is shipped with a jumper block installed on the Drive Electronics board. The specific configuration of the jumper block installed depends on the board part number and the particular installation. All jumpers are installed except for the $H M$ jumper on the Drive Electronics board.

2-10. The jumper configurations described here are found on the 09130-66501 Drive Electronics board.

2-11. The jumpers on the 09130-66501 Drive Electronics are located in a 16 pin DIP socket designated U1E. For use with the 64000 system, all jumpers should be intact except the HM jumper (U1E pins 8 and 9). The drives are normally shipped this way. The jumpers and their functions are listed in table 2-1.

Table 2-1. Mini Drive Jumpers and Functions

| Jumper Name | Installed | U1E Pin Numbers | Function |
| :---: | :---: | :---: | :---: |
| HS | X | 1 and 16 | The head load solenoid is activated when the drive is selected if this jumper is left intact. |
| DSO | YES | 2 and 15 | When this jumper is intact, the drive responds to drive address 0 . |
| DS1 | X | 3 and 14 | When this jumper is intact, the drive responds to drive address 1. |
| DS 2 | X | 4 and 13 | When this jumper is intact, the drive responds to drive address 2. |
| DS3 | X | 5 and 12 | When this jumper is intact, the drive responds to drive address 3. |
| MUX | YES | 6 and 11 | This jumper should only be used in installations having more than one drive on the controller. |
| NOT USED | X | 7 and 10 | This jumper is not used. |
| HM | NO | 8 and 9 | This jumper is not installed on the 64000 system. This jumper is not installed because the Motor ON and Drive Select signals are to operate independent of each other. |

## 2-12. TERMINATION RESISTOR PACKAGE.

2-13. On the Drive Electronics board P/N 09130-66501, the 16 pin DIP socket U2F is for insertion of the termination resistor package. The resistor package must be installed.

2-14. SOLDERED JUMPERS.

2-15. On the 09130-66501 board, Jumper wires are soldered in R50 and R56. Locations R51 and R57 are left open.

2-16. PACKAGING.

2-17. ORIGINAL PACKAGING.

2-18. Containers and packaging are available through Hewlett-Packard offices.

## 2-19. OTHER PACKAGING.

2-20. The following general instructions should be used for re-packing with commercially available materials:
a. Wrap the 64941A in heavy paper or plastic.
b. Use a strong shipping container. A double-wall carton made of 350 pound test material is adequate.
c. Use a layer of shock-absorbing material 70 to 100 mm ( 3 to 4 inches) thick around all sides of the 64941A to provide firm cushioning and prevent movement inside the container.
d. Seal the shipping container securely.
e. Mark the shipping container FRAGILE to ensure careful handling.
f. In any correspondence, refer to the instrument by model number and full serial number.

2-21. FLEXIBLE DISC MEDIA.
2-22. The storage medium used in the Mini Flexible Disc Drive, is a flexible feromagnetic disc. Both sides of the flexible disc are used for data storage. Each disc must be initialized before it can be used for data storage. The initialization procedure marks each disc track, checks for defective tracks, and establishes file directories. Refer to the formating procedure in section III of this manual and the Flexible Disc Drive Reference Manual for specific details.

2-23. FLEXIbLE DISC DRIVE hEAD CLEANING PROCEDURES.
2-24. The flexible disc drive READ/WRITE HEAD should be cleaned ONLY when a HEAD failure is suspected. Use the HP head cleaning kit, HP Model No. 92193A, to service the READ/WRITE HEAD. Contact the nearest HP Sales/Service Office for ordering information.

2-25. If a head failure is apparent, then clean it with the 92193A head cleaning kit. Follow the steps given below to clean the head.

2-26. The mainframe must be configured for Performance Verification. To do this, either press CNTR/RESET or turn the mainframe OFF and configure the control source switches on the Rear-Panel to the performance verification mode. Then power $O N$ the mainframe. The display test pattern, figure 4-1 should be on the screen. Then perform the following:
a. The flexible disc media used in the 64941A flexible disc drive is double sided. Configure the head cleaning disc for "double sided" according to the instructions given with the 92193A head cleaning kit. Insert the cleaning disc into the failing drive unit and close latch.
b. Press the DIAG softkey. The display will change to the diagnostic level.
c. Press the DIAG softkey. The display will change to the next lower level.
d. Press the TEST softkey. A list of tests will appear on the screen.
e. Press the ALT SEEK softkey. This will step the head in and out across the head cleaning disc. Let this step run for approximately 2 minutes.
f. Press ALT_SEEK again to end the test. Then press STOP TEST to exit into the next display level. Then press END_DIAG....then END_TEST to reset the mainframe.

NOTE: If the control source switches on the Rear-Panel were configured to Performance Verification for the head cleaning procedure, then they must be reconfigured to the previous state to get out of the Performance Verification mode.

SECTION III

OPERATION

## 3-1. INTRODUCTION.

3-2. Complete operation of the Flexible Disc Drive is beyond the scope of this manual. Please refer to the Flexible Disc Drive Reference Manual for complete operating instructions.

## 3-3. OPERATING CLEANLINESS.

3-4. To prevent potential damage or data loss, it is extremely important to maintain the cleanliness of the disc and air within the disc drive. The disc drive should not be operated in an environment in which dust, smoke, moisture, oil or chemical vapor or other foreign matter are present. Also, be sure to strictly follow the disc handling guidelines, found in the Flexible Disc Drive Reference Manual.

3-5. DISC LOADING.
3-6. Insert the flexible disc into the drive (be sure that the label faces up and the notch is facing left). Push the disc in until it bottoms out against the rear of the disc drive, then close the door latch. Never force the latch, as the media can be latched off center within the protective jacket.

## 3-7. WRITE PROTECTION.

3-8. The disc has the capability of being write protected. This feature prevents the accidental erasure of data previously recorded on the disc. The write protect is enabled when the write protect notch on the jacket of the disc is covered (see Figure 3-1). When the notch is uncovered, data can be written on the disc.

Figure 3-1. Write Protect Tab Installation

3-9. FORMATTING THE DISC.

3-10. Use the following procedure to format a disc:

NOTE: The floppy drives can operate in a "stand alone" or "system" configuration. The "system" configuration must have the "BUS_OP_SYS" software module. In the "stand alone" configuration, the system must have the "FLOPPY OP SYS" and "FLOPPY UTILITIES" modules. Contact the nearest Sales/Sērvice Office for more information.
(Floppy Drives In The System Configuration)
a. Turn ON mainframe. Press the "---ETC---" softkey twice until the "-BACKUP-" softkey appears.
b. Press the "-BACKUP-" softkey. The next level of softkeys will appear.
c. Press the "floppy" softkey.
d. Press the "utilities" softkey and then the carriage return key.
e. Press the "format" softkey.
f. Type in the number of the drive ( 0 or 1) that the formatting is to is to occur on ( $0=$ left drive, $1=r i g h t ~ d r i v e)$.
g. Press return.

3-11. FLOPPY DISC DIAGNOSTIC TEST.
3-12. Follow these steps to get into the Floppy Diagnostic Tests:
a. Either configure the Rear-Panel switches for performance verification and turn the mainframe OFF then ON or press CNTL/RESET to get PERFORMANCE VERIFICATION TEST DISPLAY to appear.
b. Press the DIAG softkey to get FLOPPY DISC DIAGNOSTIC to appear on the screen. Refer to figure 3-2.
c. With the FLOPPY DISC DIAGNOSTIC displayed, press the DIAG softkey to get into the first level of the floppy menu. Refer to figure 3-3.

WARNING - These tests can causpermanert loss of disc data and

$\qquad$

Figure 3-2. Floppy Disc Diagnostic Display

Figure 3-3. Floppy Test Menu First Level

3-13. The floppy disc diagnostic test uses two levels of floppy menu. The first level allows the user to set the Diagnostic test parameters by pressing the four softkeys (see figure 3-3). These are:

| DRIVE | $0 / 1$ | Alternately selects DRIVE 0 or 1 to <br> be tested when the TEST softkey is <br> pressed. The LED will be ON on the <br> DRIVE selected. |
| :--- | :--- | :--- |
| SIDE | $0 / 1$ | Alternately selects SIDE 0 or 1 to be <br> tested when the TEST softkey is press- <br> ed. |
| MIN TRACK |  |  |

3-14. The DRIVE STATUS will be displayed in the first level also (see figure 3-3). These are:

| MOTOR | ON/OFF | Motor will only be ON when in second <br> (TEST) level of diagnostic. |
| :--- | :--- | :--- |
| MEDIA CHANGE | ON/OFF | Indicates a write protect switch <br> closure has occurred. Reset by <br> selecting other drive. |
| WRITE PROTECT | ON/OFF | Indicates the state of the write <br> protect switch (ON=open). |
| TRACK00 INDICATOR ON/OFF | Indicates the state of the track00 <br> signal (ON=head over track00). |  |

3-15. After the TEST PARAMETERS have been set up, press the TEST softkey. The floppy second level menu will appear (see figure 3-4). The display will remain the same (motor status will now be ON ), only the softkeys will change.

Figure 3-4. Floppy Test Menu Second Level

3-16. There are eight different tests on the softkeys. The functions of each are explained from left to right (the user is facing the terminal).
a. RESTORE - Issues 255 step pulses to step the head toward track 00. The user should check track 00 indicator status to make sure that it is ON .
b. STEP IN - Each time this softkey is pressed the head is stepped in toward track 34.
c. STEP OUT - Each time this softkey is pressed the head is stepped out toward track 00 .
d. SEEK - Each time this softkey is pressed it must be followed by the track number to be SEEKED. When the return key is pressed, the head will move to the selected track and read the ID information on that track and compare it to the track being SEEKed. If they do not match, a error message will appear on the command line (Seek Error, Track not Verified). If the ID information is verified then the message, Seek Verified will appear on the command line.
e. ALT SEEK - Causes the head to alternate between MIN TRACK and

MAX TRACK. Each time the head is moved, the CPU reads the ID information on the MIN TRACK or MAX TRACK and compares it to the desired head position. If an error occurs, it will be displayed as a SEEK ERROR. There are four messages given for this test, SEEK ERROR, DISC DOWN, TOTAL ERRORS, TOTAL TESTS (the last three are updated with each test). To exit this test, press the ALT SEEK softkey again.
f. READ - The READ TEST reads each sector of the the track
which has been selected by the STEP IN/OUT or SEEK
softkeys. Each time a sector is read, the CPU checks
the status register in the MDC chip for the follow-
errors: ID CRC (Cyclic Redundancy Check), LOST DATA,
DATA CRC, RFN (Record Not Found). If an error occurs,
the read error field will be updated.
g. RD/WR/VRF - In addition to the tests performed in the read test, the RD/WR/VRF test also writes a random data pattern on each sector of the selected track then reads this information back and verifies that it is the same as the information written. If not the VRF error field will be updated to indicate the type of error and sector of the occurrence.
h. STOP TEST - This softkey allows the user to go from the floppy
test menu second level into the first level.

3-17. TEST ERRORS.

ID CRC If the CRC error bit has been set in the status register after the ID field has been read, the number of ID CRC errors in that sector will be incremented.

LOST DATA
When this error occurs, it indicates the host system did not respond to LDRQ (Low Data Request) in one byte time (32uS). The number of LOST DATA errors will be displayed in the sector of occurrence.

DATA CRC If the CRC error bit has been set in the data register, the number of occurrences will be displayed in the sector where it took place.

RNF When this error occurs, it indicates that the desired track, sector, or side which was read in the ID field, did not correspond to the track, sector, or side being tested.

VERIFY When this error occurs, it indicates that that data pattern read was not the same as the data pattern written by the host system.

## SECTION IV

## PERFORMANCE VERIFICATION

4-1. INTRODUCTION.
4-2. This section describes the Performance tests for the Flexible Disc Drive Local Mass Storage. There are two modes of testing, performance verification and operation verification. Refer to the Mainframe Service Manual for more information on initiating performance verification.

4-3. The Performance Verification test will verify to an $85 \%$ confidence level that the flexible disc drive(s) are operational.

4-4. The Operation Verification procedures allow the operator to verify all specifications. With the aid of the error code and descriptions in the troubleshooting portion of Section VIII, troubleshoot the mini flexible (floppy) disc drives from the mainframe keyboard.

4-5. PERFORMANCE VERIFICATION TEST PROCEDURE.
4-6. In order to initiate mainframe performance verification (PV) the following methods may be used:
a. Place the control source switches in the performance verification position shown on the control source label on the RearPanel.
b. Turn power OFF then back ON. The display test pattern, figure 4-1, should be on screen.
c. Press the PVIESTS softkey.
d. Press the NEXT TEST soft key until the FLOPPY DISC DRIVE test is displayed. See figure 4-2.
e. Press START to initiate the test. Press START again to stop test.
f. If no more tests are required, change control source switches to the desired boot source and press END TESTS and the system will reboot.

OR
g. There is another method that can be initiated from the front panel when a boot is from a hard disc or flexible disc (floppy) if the operating software has been loaded. To do this Press CNTL and RESET together.

$\qquad$ nisk $\qquad$ $\square$ $\qquad$ M Tcis

Figure 4-1. Display Test Pattern

Figure 4-2. PV Test Display

4-7. During the Floppy test the mainframe software will perform eight tests on the flexible disc drives. A description of each test is given in section VIII. The following is the sequence of events that occurs during a test cycle.

NOTE
It is required that a formatted disc be used when performing the floppy PV. Also, the WRITE electronics are not tested if a disc containing data on track 34 is present in the drive being tested. Furthermore, the floppy $P V$ will only verify to an $85 \%$ confidence level that the mini drives are operational. In order to completely test the drives, the floppy drive diagnostics (operation verification) must also be done.

Purpose:
The FLOPPY DISC TEST tests several functions of the two floppy disc drives and the controller board electronics.

Area Tested:
CPU and I/O data lines, Disc Drive Controller board electronics, the cable from the Controller board to the drives, Drive READ/WRITE electronics and mechanics, and the CPU, I/O and disc drive I/O data and control line cable.

Operation:
a. Response from the Disc Drive Controller chip is tested by writing a pattern to the track register in the Mini Disc Controller chip (MDC) and reading it back.
b. When initiated, each disc drive is cycled through the following series of tests:

1. The drive is selected.
2. The drive is restored (head moved to track 00).
3. Step inward to track 1 (check TRKOO indicator OFF)
4. Step out to track 00 , check track 0 indicator $0 N$.
5. Read all sectors on track 0 , side 0 ; check for all errors.
6. Step to track 34, read all sectors on both sides.
c. The PV routines now check to see if there is any data on track 34. Track 34 will be a spare track on a disc with no bad tracks. However, if there is a bad track on a disc, then track 34 is allocated as useable even though it may contain information.
d. If data exists on track 34, a READ/WRITE test is not performed and a message indicating this is displayed on the CRT. If track 34 is available, the following is performed:
7. Known data on side 0 , sector 0 is READ.
8. A random data pattern is written to side 0 , sector 1.
9. The pattern is read from side 0 sector 1 and compared with what was written.
10. Steps 7,8 and 9 are repeated on track 34 , side 1 .

4-8. When a test fails an error message is displayed. Refer to table 8-1 (Mini Floppy PV Error Messages) for a quick reference explanation of the error messages, and refer to table 8-2 for a detailed description of each error message and some possible trouble and corrective measures to service a failure.

4-9. When the test passes, a binary error word is displayed which indicates the area of previous failures. This word will contain a one wherever a failure has previously occurred and can be decoded to correspond with the error messages normally displayed. Refer to table 8-1 for an explanation of the error messages.

4-10. OPERATION VERIFICATION TESTS.
4-11. In order to perform the operation verification tests, the following sequence should be used to access the DIAG mode tests:
a. Place the control source switches in the performance verification position shown on the control source label on the Rear-Panel.
b. Turn power OFF then back ON. The display test pattern, figure 4-1, should be on screen.
c. Press the DIAG soft key. Figure 4-3 should be displayed.
d. Press the DIAG soft key again. Figure 4-4 should be displayed.
e. Set up desired tests and press the TEST soft key to initiate. Figure 4-5 should be displayed.
f. When the desired test is finished press the STOP TEST soft key.
g. Press END DIAG to exit the DIAG mode. The display test pattern should be on screen.

## Figure 4-3. Floppy Disc Diagnostic Display

EnD : Returns to performance verification tests

NiAK nSE MSE 2

Figure 4-5. Floppy Test Menu Second Level

4-12. Perform all or part of the following tests to verify that the mini drives are operating properly:

NOTE

The Performance Verification procedure should be performed prior to the Operation Verification procedures. When the DIAG mode is required, use the sequence described in paragraph 4-10 to access the DIAG tests.

4-13. MEDIA CHANGE TEST.
a. Go to DIAG mode and make sure media change indication "ON" occurs when media is removed and reset, "OFF" when other drive is selected.

4-14. MOTOR CONTROL TEST.
a. Remove both discs from drives and leave doors open.
b. Go to DIAG mode and observe that drive spindle only turns when motor indication for that drive is in the "TEST" mode.

## 4-15. DRIVE READY TEST.

a. When running the Operation Verification "READ" test, open the door of each drive and observe "...Disc Down..." failure for the drive being tested.

4-16. DRIVE SELECT TEST.
a. Go to DIAG mode and observe drive select LEDs to make sure that the corresponding LED is only ON when drive is selected.

4-17. FORMAT A DISC.
(check for index pulses at the MDC)
a. Refer to disc format procedure given in Section III of this manual.

4-18. HEAD ALIGNMENT TEST.

4-19. This test requires performing Steps (a) through (i) of the Radial Head Alignment procedure and then the Head Azimuth Alignment Check. The Radial Head Alignment procedure is found in Section V.

NOTE

The Radial Head Alignment is a difficult procedure! (Steps (a) through (i) are a check only.)

4-20. HEAD AZIMUTH ALIGNMENT CHECK.
4-21. The head azimuth is not field adjustable due to its very delicate nature. For this reason, the nearest $H P$ Sales/Service Office should be contacted to have this adjustment done. To determine whether the head azimuth is out of limits, perform the following procedures:
a. Use the procedure in section $V$ to setup Mini Drive as shown in figure 5-1.
b. Call up the DIAG test on the mainframe.
c. Insert the alignment disc $\mathrm{P} / \mathrm{N} 9164-0151$ into drive and close the latch. the latch.
d. Select side and drive to be checked.
e. Step to Track 16.
f. Connect and setup the scope as follows:

| Trigger | Ch. A (pos) |  |
| :--- | :--- | :--- |
| Display | Ch. B |  |
| Sensitivity | Ch. A 1V/Div |  |
|  | Ch. B .1V/Div |  |
| Time/Div | . 5msec/Div |  |
| Coupling | Ch. A DC |  |
|  | Ch. B AC |  |
| Connections | (Drive Electronics | Board) |
|  | Channel A | Channel B |
| Signal | TP7 (INDEX) | TP4(READ DATA) |
| Gnd | TP6 (GND) | TP10 (GND) |

g. Observe the waveform at TP4 should look similar to that of Figure 4-6. Examine the waveform for heads 1 and 2. If lobe $A$ is greater in amplitude than lobe $B$ or if lobe $D$ is greater in amplitude than lobe $C$, then the head azimuth is out of alignment.
h. Check both heads by selecting one side, perform the check then select the other side. The side selection is made during test set-up from the mainframe.

Figure 4-6. Head Azimuth Waveform

## SECTION V

ADJUSTMENTS
5-1. INTRODUCTION.
5-2. This section provides the adjustment procedures for the mini flexible disc drive. These procedures are recommended to return the drive to its original optimum performance after maintenance or repair. Included at the beginning of each procedure is a list of required tools. Table 1-2 in section $I$ is a list of all the required tools. All these procedures assume the access to the service equipment listed in table 1-2 of this manual is available.

5-3. There are two catagories of adjustments given in this section. The first two procedures are the spindle motor speed and spindle motor drive adjustments. These first two adjustments may be performed in the field. The second set of adjustments are; Radial head alignment, track 0 switch adjustment, index emitter/detector adjustment, and the write protect switch adjustment. These adjustments should not be performed except in emergency situations due to their delicate nature. These adjustments are NEVER to be performed at the customers location. If a non-field adjustment needs to be done, contact the nearest HP Sales/Service Office. Locations and addresses are given at the back of this manual.

5-4. TEST AND ADJUSTMENT DRIVE ACCESS PROCEDURE.
5-5. The following procedure is a general set up procedure which allows access to the flexible disc drive for testing and adjustments:
a. Remove flexible disc drive from mainframe by reversing the installation procedure (paragraph 2-4 in section II) and place it along side the mainframe.
b. Supply power and control to the flexible disc drive by connecting the power and control extender cables between the control board and the drive unit. Make SURE that pin one on the control board is connected to pin one on the drive under test. The part number for the mini power extender cable is HP $\mathrm{P} / \mathrm{N}$ 64110-61620, and the part number for the mini control extender cable is HP P/N 8120-4020.

5-6. FIELD ADJUSTMENTS.
5-7. SPINDLE MOTOR SPEED ADJUSTMENT.
5-8. The spindle motor speed should be re-adjusted whenever a new spindle motor or Servo Electronics board is installed. Refer to figure 5-1 while making this adjustment.
a. Required Tools:

1. Alignment tool or small insulated shank screwdriver.
2. HP 5314A or equivalent frequency counter (if primary power frequency is unknown or unstable or when adjusting motor speed under incandescent lighting).

Figure 5-1. Spindle Motor Speed Adjustment

5-9. KNOWN PRIMARY POWER AND FLUORESCENT LIGHTING.
5-10. Follow these instructions when primary power is a known 50 or 60 Hz and this adjustment is done under fluorescent lighting.
a. Check the spindle pulley to see that it has a strobe label $\mathrm{P} / \mathrm{N}$ 71211451.
b. Enter the DIAG Test on the mainframe. Refer to section IV, operation verification tests.
c. Select the drive to be adjusted.
d. Press TEST and note the motor status light is ON indicating the drive motor is running.
e. Observe the strobe pattern on the spindle pulley. For 50 Hz primary power observe inner pattern. For 60 Hz , observe the outer pattern.
f. Locate and adjust the potentiometer on the servo board until the proper pattern on the strobe label stabilizes. Refer to figure 51.

5-11. PRIMARY POWER FREQUENCY IS UNSTABLE OR UNKNOWN.
5-12. If the primary power frequency is unstable or unknown, follow these instructions:
a. Connect the frequency counter input to TP7 (index) and TP6 (ground) on the Drive Electronics board.
b. Enter the DIAG Test on the mainframe. Refer to section IV operation verification tests.
c. Select the drive to be adjusted.
d. Press TEST and note the motor status light is $O N$ indicating the drive motor is running.
e. Locate and adjust the potentiometer on the servo board until a $200 \mathrm{~ms}+/-1 \%$ period is observed on the counter display. This will assure a 300 RPM spindle speed. Refer to figure 5-1.

5-13. SPINDLE DRIVE BELT ADJUSTMENT.
5-14. This adjustment is to ensure proper drive belt tension. This adjustment should be made whenever the drive belt or drive spindle motor is replaced.

Figure 5-2. Spindle Drive Belt Adjustment
a. Required Tools:

1. \#1 Pozidriv screwdriver or equivalent
2. Spindle motor adjustment tool P/N 8710-1385
b. Refer to Figure 5-2 while performing these steps:
c. Place the drive assembly on its side so that the bottom of the drive faces you.
d. Remove the drive belt.
e. Place the spindle motor adjustment tool on the bottom of the drive as shown in Figure 5-1 so that the small end of the adjustment tool rests against the motor pulley and the large end rests against the spindle pulley.
f. Slightly loosen the spindle motor retaining screws and move the motor until it rests firmly against the adjustment tool.
g. Re-tighten the spindle motor retaining screws and reinstall the drive belt.

NOTE
There is a good chance that the drive motor is not exactly perpendicular to the drive casting on which it is mounted. This will cause the drive belt to slip from the drive pulley when it is rotated. After a belt is installed, rotate the drive spindle approximately 10 revolutions to insure the belt will not slip from the drive pulley.

5-15. FACTORY ADJUSTMENTS.
5-16. The following adjustments should not be performed except in emergency situations due to their delicate nature. These adjustments are NEVER to be performed at the customers location.

5-17. The adjustments described in this section are:
a. Radial Head Alignment
b. Track 0 Switch Adjustment
c. Index Emitter/Detector Adjustment
d. Write Protect Switch Adjustment

5-18. REQUIRED TOOLS AND TEST EQUIPMENT.
a. Oscilloscope
.HP 1740 A or equivalent
b. Alignment Disc
P/N 9164-0151
c. Torque Driver.................................... $P$ /N 8710-0670
d. \#1 Pozidriv Screwdriver or equivalent........ P/N 8710-0899
e. \#2 Pozidriv Screwdriver or equivalent.........P/N 8710-0900
f. 3/16 Thin Wall Nutdriver or equivalent....... P/N 8720-0001

5-19. RADIAL HEAD ALIGNMENT.

NOTE

Steps (a) through (i) serve as a radial head alignment check.

NOTE
If radial alignment steps (j) through (1) are performed, track 0 adjustment will be required. The track 0 adjustment is an extremely difficult adjustment.

Figure 5-3. Radial Head Alignment Waveform

5-20. To properly align the read/write heads, perform to the following steps in the order shown. Refer to table 8-2, section VIII for head misalignment symptoms.
a. Connect equipment as in procedure in paragraph 5-5.
b. Enter the DIAG test on the mainframe. Refer to section IV operation verification tests.

Figure 5-4. Head Assembly Retaining Screws
c. Insert the Alignment disc P/N 9164-0151 into the drive and close the latch.
d. Select the drive and side to be tested and press the TEST softkey.
e. Press the RESTORE softkey.
f. Step to track 16
g. Connect and setup the scope as follows:

| Trigger | Ch. A (Pos) |
| :--- | :--- |
| Display | Ch. B |
| Sensitivity | Ch. A 1V/Div |
|  | Ch. B .1V/Div |
| Time/Div | 20msec |
| Coupling | Ch. A DC |
|  | Ch. B AC |
| Connections | (Drive Electronics Board) |
|  | Channel A |
| Signal | TP7 (INDEX) |
| Gnd | TP6 (GND) |

h. With the scope connected, the pattern shown in Figure 5-3 should be observed.
i. Both lobes of the pattern should be within $80 \%$ in amplitude of each other. If doing a check repeat steps (a) through (i) with the other side of disc selected.
j. If the amplitude of one of the lobes of the waveform is less than $80 \%$ (. 8 mils ) of the other, slightly loosen the three screws shown in figure 5-4 and adjust the radial head alignment by gently turning the head alignment cam screw.
k. After the radial alignment has been completed, retighten the three screws loosened in step (j) while observing the scope pattern. Tighten the retaining screws with the torque-driver set at 8 inch-pounds.

1. Check the other side by selecting the other side in the DIAG test set-up.

5-21. TRACK 0 SWITCH ADJUSTMENT. (extremely difficult adjustment)

5-22. Track 0 switch adjustment should be performed whenever the radial head alignment is changed. To properly adjust the track 0 switch, follow these steps in the order shown:
a. Connect the equipment as in the procedure in paragraph 5-5.
b. Insert a formatted disc into the drive.
c. Go to DIAG mode (refer to section IV operation verification tests) and set MIN TRACK to 0 and MAX TRACK to 4.
d. Press TEST then RESTORE and then ALT SEEK.
e. Connect and setup the scope as follows:

| Trigger | Internal on Ch. A (POS) |
| :--- | :--- |
| Display | Ch. B |
| Sensitivity | Ch. A 1V/Div |
|  | Ch. B 2V/Div |
| Time/Div | 5mS/Div |
| Coupling | Ch. A DC |
|  | Ch. B AC |

Connections (Drive Electronics Board)

|  | Channel A | Channel B |
| :--- | :--- | :--- |
| Signal | TP12 (STEP) | U4F pin 1 |
| Gnd | TP10 (GND) | TP6 (GND) |

f. With the scope connected and setup, the waveform should be similar to that of figure 5-5. The duration from T0 to T1 must be less than 18 mS and the duration from $T 0$ to $T 2$ must be less than 24 mS . If these times are within the limits, no adjustment is necessary. If either of the time limits is exceeded, proceed with steps (g) thru (1).

Figure 5-5. Track 0 Waveform

Figure 5-6. Track 0 Retaining Screw
g. Remove connectors P5 and P6 from the front of the drive board.
h. Rest the drive board on a piece of insulating material such as cardboard.
i. Slightly loosen the track 0 switch retaining screw shown in figure 5-6.
j. Adjust the switch position until the time requirements in step (f) are met.
k. With the torque driver adjusted to 8 inch-pounds, retighten the track 0 switch retaining screw while observing the oscilloscope pattern (refer to Figure 5-5).

1. Reinstall the drive board and connectors P5 and P6. Tighten the board retaining screws with the torque driver set to 8 inch pounds.

5-23. INDEX EMITTER/DETECTOR ADJUSTMENT.
5-24. This adjustment is required when the index emitter/detector assembly has been replaced. Perform this adjustment as follows: steps:
a. Connect the equipment as in the procedure in paragraph 5-5.
b. Place drive on its side with bottom facing you as in figure 5-7.
c. Go to DIAG mode. See section IV operation verification tests.
d. Insert alignment disc into the disc and close the latch.
e. Select drive to be tested and press TEST soft key.
f. Press RESTORE, step to track 16 , side 0 .
g. Connect and setup the oscilloscope as follows:

Figure 5-7. Index Detector Retaining Screw
h. The oscilloscope presentation should appear as shown in Figure 5-8.
i. Loosen the index detector retaining screw (Figure 5-7) and move the detector until the INDEX to DATA burst time is approximately 400 uS $+/=300$ uS for side 0 .
j. Retighten the index detector retaining screw using the torque driver set to 8 inch pounds while observing the scope.
k. Check the INDEX and DATA time for head 1 by going to the DIAG mode and selecting side 1 , then press TEST.

1. If the INDEX to DATA time is too far out, adjust the index emitter located on the top side of the drive assembly and then redo steps (i) through (k).
$m$. Tighten the index emitter and detector retaining screws using the torque driver set to 8 inch pounds.
n. Reassemble the drive assembly.

5-25. WRITE PROTECT SWITCH ADJUSTMENT.
5-26. The disc drive head assembly may be severely damaged while performing this adjustment. For this reason, replacement or adjustment of this switch is not to be done in the field.

Figure 5-8. Index to Burst Waveform

## SECTION VI

REPLACEABLE PARTS

## 6-1. INTRODUCTION.

6-2. This section contains information for ordering parts. Table 6-1 lists abbreviations used in the parts list and throughtout the manual. Table 6-2 lists all replaceable parts in reference designator order. Table 6-3 contains the names and addresses that correspond to the manufacturer's five-digit code numbers.

## 6-3. ABBREVIATIONS.

6-4. Table 6-1 lists abbreviations used in the parts list, schematics, and throughout the manual. In some cases, two forms of the abbreviation are used: one, all in capital letters; and two, partial or no capitals. This occurs because the abbreviations in the parts list are always capitals. However, in the schematics and other parts of the manual, other abbreviation forms are used with both lowercase and uppercase letters.

6-5. REPLACEABLE PARTS LIST.
6-6. Table 6-2 is the list of replaceable parts and is organized as follows:
a. Chassis-mounted parts in alphanumerical order by reference designator.
b. Electrical assemblies and there components in alphanumerical order by reference designator.
c. Miscellaneous.

## 6-7. ORDERING INFORMATION.

6-8. To order a part listed in the replaceable parts table, quote the Hewlett-Packard part number and check digit, indicate the quantity required, and address the order to the nearest Hewlett-Packard Sales/Service Office.

## 6-9. DIRECT MAIL ORDER SYSTEM.

6-10. Within the USA, Hewlett-Packard can supply parts through a direct mail order system. Advantages of using the system are as follows:
a. Direct ordering and shipment from the HP Parts Center in Mountain View, California.
b. No maximum or minimum on any mail order (there is a minimum order amount form parts ordered through a local HP Sales/Service Office when the orders require billing and invoicing).
c. Prepaid transportation (there is a small handling charge for each order).
d. No invoices - to provide these advantages, a check or money order must accompany each order.

6-11. Mail-order forms and specific ordering information are available through your
local HP Sales/Service Office. Addresses and phone numbers are located at the back
of this manual.
6-12. The Model 64941A Floppy Drive Control Board is now supported by the Bluestripe program. The Bluestripe pipeline contains replacement boards for 64000 options made by Hewlett-Packard. The replacement board for the Model 64941A is available at the factory. For additional information, contact your nearest Hewlett-Packard representative. The Bluestripe replacement part number for the 64941A Floppy Drive Control Board is 64941-69502.

## SECTION VII

## MANUAL BACKDATING

7-1. GENERAL .
7-2. There is no backdating material at the printing of this manual.

## SECTION VIII

## SERVICE

8-1. INTRODUCTION.

8-2. This section provides information to service the flexible disc control and drives. If an error has occurred while using the flexible disc drive option, use this section to diagnose the problem and troubleshoot it.

8-3. This section is divided into two groups. The first contains the fundamentals of flexible disc recording, and block and component level theory-of-operation. This information should help the user understand the operation of the flexible disc drive. The second portion contains troubleshooting information. This includes descriptions of the error messages given during PV and DIAG tests, troubleshooting using signature analysis, troubleshooting hints, and detailed service sheets.

## 8-4. SAFETY CONSIDERATIONS.

8-5. Read the Safety Summary at the front of this manual before servicing this instrument. Review each procedure before performing it for CAUTIONs and WARNINGs given in the procedures. For example, when working around the power supply and the display circuitry in the mainframe; CAUTION should be taken to avoid the potentially lethal voltages! In general however, the flexible disc drives use only +-12 Volts and +5 Volts.

## 8-6. FLEXIBLE DISC RECORDING FUNDAMENTALS.

8-7. To better understand the operation of the flexible disc drive, read this brief description of disc recording principles. Refer to figures 8-1 through 8-3 while reading this section.

8-8. The flexible magnetic media used with the 64100 A option 041 disc drive measures 5.25 inches in diameter. Both surfaces are coated with a ferromagnetic iron oxide. Both sides are used for data storage. Each side contains 35 circular tracks. Each track is divided into 16 pie slice shaped regions called sectors. A sector can contain up to 256 bytes of data. Surface, track and sector information is used to reference data location on the disc. Data is encoded on the disc (ones and zeros) by changing the orientation of small magnetic dipoles in the magnetic coating on the disc. There is no correlation between magnetic polarity of the dipoles and the ones and zeros. The ones and zeros are indicated by the location of the dipole polarity transitions.

8-9. The disc is soft sectored; that is, there is no hardware indication of where each sector begins. In order to allow soft sectoring, each sector is divided into two fields. For each sector there is an ID field which contains information to identify the sector. Next there is a data field which contains the actual data. Thus, the ID field serves as a fixed marker for the beginning of each sector.

8-10. The makeup of the ID and DATA fields are similar. Both fields begin with a series of synchronization bytes (zeros). These bytes allow the decoder circuitry of the controller time to synchronize itself with the data on the disc. Following the synchronizing bytes, is the address mark byte which indicates that the beginning of an ID or DATA field has been located. The address mark is a specially recorded data pattern that does not occur in any data stream and is used to sychronize the data decoding circuits in the Mini Disc Controller (MDC).

8-11. A series of information bytes follows the address mark. In an ID field, these bytes indicate the logical cylinder, head and sector address. In a DATA field, these bytes are the data being stored in the sector.

8-12. At the end of each field are two cyclic redundance check (CRC) bytes. This check word ( 16 bits long) allows detection of most errors that occur in the data storage and recovery of information from a disc.

8-13. There are two gaps following each field on a track. The gaps allow for variations in disc rotational speed, index detector alignment variations and time for the hardware to prepare for the next field.
$8-14$. The logical sectors are numbered consecutively. However, the sectors (see figure 8-2) may occur in any physical order around the track. This allows the sectors to be staggered to optimize system performance (interleaving).

8-15. The outermost track on the disc is track 0 and the intermost track is 34. Each track has a physical address as described previously. There is also a logical track address associated with each good track. The logical track address is written in the ID field of each sector on the track.
$8-16$. The recording head (see Figure $8-3$ ) is moved in and out by a stepper motor as sembly. Write current passes through the head coil to selectively magnetize portions of the disc. To read back data, the magnetized material is passed under the head.

Figure 8-2. Media Sector and Track Structure

Figure 8-3. Head Positioning Assembly

8-17. BLOCK DIAGRAM THEORY.
8-18. The Local Mass Storage is divided into two major functions; the first function is the Mini Controller, and the second is the flexible disc drives.

8-19. The block diagram for the Mini Controller and Flexible Disc Drive functions is shown on figure 8-4. The left half of the Block diagram is the Mini Control board A11 and the right half is showing the Flexible Disc Drives (Drive 0 and 1) with drive 0 showing the internal functions. Figure $8-5$ is a more detailed block diagram of the flexible disc drives.

8-20. MINI CONTROL BLOCK THEORY.
8-21. The Mini Controller is part of the 64100 A mainframe. It interfaces the flexible disc drives with the mainframe by supplying the drive with power, data, timing, and control signals.

8-22. The Mini Controller is divided into eleven subfunctions.
a. Interface Control Latch
b. DMA/CPU Address Selector
c. SA Stimulus Latch
d. CPU Interface/DMA State Machine
e. Data Latches
f. 4 MHz Oscillator
g. Mini Drive Controller
h. Drive Control Latches/Buffers
i. Drive Status Buffers
j. Data Separator
k. Disc Drive Multiplexer and Control Buffering

8-23. INTERFACE CONTROL LATCH.
8-24. Refer to figure 8-4. The control latch is responsible for capturing the upper byte of I/O data and providing this information to the DMA/CPU Address selector.

8-25. DMA/CPU ADDRESS SELECTOR.
8-26. Refer to figure 8-4. The address selector, which is gated by the state machine, generates control signals to the Mini Drive Control chip (MDC). The state of the control signals is determined by the output of the interface control latch.

8-27. SIGNATURE ANALYSIS STIMULUS LATCH.
8-28. Refer to figure 8-4. The output of the SA stimulus latch can be connected to either the input of the DMA state machine, jumper E2, or to the inputs of the data separator circuitry, jumper E1. This facilitates troubleshooting of the DMA state machine and data separator by forcing them into known state sequences.

8-29. CPU INTERFACE/DMA STATE MACHINE.
8-30. Refer to figure 8-4. The CPU Interface/DMA State Machine performs two functions. First, a major portion of the circuitry does byte packing and unpacking so that the 16 bit $I / O$ bus can interface to the 8 bit bus of the MDC. Second, the state machine provides signals for enabling the data latches and providing next state information for itself.

8-31. DATA LATCHES.
8-32. Refer to figure 8-4. The data latches are used for loading and transfering 8 bit read/write, status and control signals to and from the drive circuitry from the 16 bit 64100A I/O bus. The enabling and clocking of the data latches is performed by the DMA state machine.

8-33. 4 MHZ OSCILLATOR.
8-34. Refer to figure 8-4. The oscillator block is comprised of a 4 Mhz crystal oscillator that is used to clock a 4 bit binary counter. The 2 Mhz and 500 Khz outputs are used to clock the data separator and the 1 Mhz output is used to clock the Mini Drive Controller chip.

8-35. MINI DRIVE CONTROLLER (MDC) CHIP.
8-36. Refer to figure 8-4. The Mmini Drive Controller (MDC) chip is divided into two functions. The first is the microprocessor interface that uses control signals to determine whether it is in a read or a write mode. Then, once it has determined it's $R / W$ status it will then read or write data via the data access lines to the data latches. The second section, the disc interface, implements the commands from the microprocessor interface section. The disc interface section processes commands and status signals from the disc drive MUX. Also, the MDC will provide encoded information to be written onto the disc and a means of decoding read data to be output to the system.

8-37. DRIVE CONTROL LATCH/BUFFER.
8-38. Refer to figure 8-4. This block is responsible for providing control signals to each disc drive.

8-39. DRIVE STATUS BUFFERS.
8-40. Refer to figure 8-4. The drive status buffers provide the system with information necessary to determine the status of the disc drives.

8-41. DATA SEPARATOR.
8-42. Refer to figure 8-4. This block is responsible for dividing the 1 's and 0 's on the data stream into half bit cells, and phase locking this data for use by the MDC. The data stream consists of raw encoded information from the disc. Furthermore, the raw read information is delayed and phase locked with a read clock as soon as seven sync bytes have been read from the disc.

8-43. DISC DRIVE MULTIPLEXER AND CONTROL BUFFERING.
8-44. Refer to figure 8-4. This block is the final interface to the disc drives. The multiplexer selects between the two sets of signals going to/from the two flexible disc drives depending on which drive is currently active.

8-45. DISC DRIVE BLOCK THEORY.
8-46. This section describes the block digram theory for the disc drives. Figure 8-5 is a detailed block diagram of the disc drives.

8-47. INDEX PULSE SHAPING NETWORK.
8-48. The index pulse circuitry consists of an index LED, photo transistor and pulse shaping network. The index hole in the flexible disc passes between the index LED and photo transistor, causing the photo transistor to conduct. The detected signal is then shaped and buffered and output on the Index Pulse interface line (J1-8). This signal although inverted may be observed at TP7 on the Drive Electronics board.

8-49. WRITE PROTECT SENSOR.
8-50. The write protect sensor consists of a switch which is opened when a write protected disc is inserted into the drive. This signal is delayed by an RF filter to eliminate transient noise from the switch. This will cause the write protect line (J1-28) to go low and TP9 to go high.

8-51. TRACK 0 SWITCH.
8-52. The level on the Track 0 interface is a function of the head assembly position. When the head assembly is positioned at track 0 and the stepper motor indicates phase 0, J4-19 is pulled low, causing TP8 and the Track 0 interface line to be pulled low.

## 8-53. SPINDLE MOTOR DRIVE CONTROL.

8-54. The spindle drive system consists of a spindle assembly driven by a DC motor tachometer combination and the Servo Electronics board.

8-55. The Servo Electronics includes a current limiter and interface control line
8-56. When the Drive Motor Enable line is low, the drive motor is allowed to come up to speed. This speed is adjustable by potentiometer R4 located on the Servo Electronics board

8-57. A current sensing resistor, also located on the servo electronics board limits the motor current to 900 mA . If this limit is exceeded, the notor is disabled

8-58. HEAD POSITION CONTROL.
8-59. The head position control consists of a four phase stepper motor drive which changes one phase for each track advancement of the head assembly. In addition to the logic for motion control, a gate is provided to inhibit repositioning during a write operation.

## 8-60. POWER ON CIRCUIT.

8-61. This circuit detects when the $+5 V D C$ and $+12 V D C$ are valid and prevents writing/reading/erasing/stepping until such time.

## 8-62. DATA CIRCUITRY.

8-63. All signals required to control the data circuitry are provided by the host system and are shown in the functional block diagram of Figure 8-5. These signal are as follows:
a. Drive Select
a. Drive Selec
c. Write Data
d. Side Select

8-64. There are 4 drive select lines connected to the data electronics. A shunt block determines the drive number. The drive $n$ mber is established by clipping three of the jumpers on the shunt block or adding a shunt to an empty block. When the selected drive select line is pulled low, the data circuitry is enabled and the drive is conditioned to respond to step or read/write commands. On the 641001 option 041 all of the jumpers are intact and the drive is enabled with DSO.

Figure 8-5. Mini Drive Block Diagram

8-65. WRITING DATA.
8-66. The write electronics consists of the following circuits:
a. Write/erase current source
b. Waveform generator
c. Trim erase current source
d. Head select logic
e. Bias Source

8-67. The read/write winding on the head is center tapped. During a write operation, the current from the write current source flows in the alternate halves of the winding under the control of the write waveform generator.

8-68. Before recording can begin, certain conditions must be satisfied. The conditions required before writing (i.e., unit ready) must be established by the host system as follows:
a. Drive speed stabilization. This will exist 250 mS after starting the drive motor.
b. Subsequent to any step operation, the positioner must be allowed to settle. This requires 20 mS total after the last step pulse is initiated, i.e., 5 mS for the step motion and 15 mS for settling.

8-69. The following operations are performed when writing data. These operations may be overlapped if required.

8-70. Figure 8-6 shows the relevent timing diagram for a write operation. At $T=0$ when the unit is ready, the write enable line goes low. This enables the write current source and bias circuitry.

8-71. Since the trim erase gaps are behind the read/write gap, the TRIM ERASE control goes true $390 u S$ after the WRITE ENABLE interface line. It should be noted that this value is optimized between the requirements at track 0 and track 34 so that the effect of the trim erase gaps on previous information is minimized.

8-72. Figure 8-6 shows the information on the WRITE DATA interface line, and the output of the write waveform generator which toggles on the leading edge of every WRITE DATA pulse.

8-73. At the end of recording, at least one additional pulse on the WRITE DATA line must be inserted after the last significant WRITE DATA pulse to avoid excessive peak shift effects.

8-74. The TRIM ERASE signal must remain true for $800 u S$ after the termination of WRITE ENABLE to ensure that all recorded data are trim erased. This value is again optimized between the requirements at track 0 and 34 .

8-75. The duration of a write operation is from the true going edge of WRITE ENABLE to the false going edge of TRIM ERASE. This is indicated by the internal WRITE BUSY waveform shown.

8-76. READING DATA.
8-77. The read electronics consists of the following circuitry:
a. Read switch/side select
b. Read amplifier
c. Filter
d. Differentiator
e. O Crossing detector

8-78. The read switch is used to isolate the read amplifier from the voltage excursion across the magnetic head during a write operation. The side select is used to enable one of the read/write/erase heads.

8-79. Before reading can begin, the drive must be in a ready condition. As with the data recording operation, this ready condition must be established for data recording. A 100 us delay must exist from the trailing edge of the TRIM ERASE signal to allow the read amplifier to settle after the transient caused by the read switch returning to the read mode.

8-80. Referring to figure $8-7$, the output signal from the read/write head is amplified by a read amplifier and filtered to remove noise by a linear phase filter. The linear output from the filter is passed to the differentiator which generates a waveform whose zero crossovers correspond to the peaks of the read signal. This signal is then fed to the comparator and digitizer circuit.

Figure 8-6. Write Timing Diagram

8-81. The comparator and digitizer circuitry generates a $1 u S$ READ DATA pulse corresponding to each peak of the read signal. This composite read data signal is then sent to the host system via the READ DATA interface line.

8-82. MINI CONTROL THEORY OF OPERATION.
8-83. MINI CONTROL.
(See service sheets 11A, 11B figures 8-9 and 8-11)
8-84. The CPU may execute $I / O$ to any 1 of 16 peripheral addresses (defined by LPA $0-3$ ) and to any one of four registers at each address. The state of the CPU registers are defined by the state of LIC1 and LIC2:

| LIC2 | LIC1 | Register | Function |
| :--- | :---: | :---: | :--- |
| H | H | R4 | All DMA except last byte |
| H | L | R5 | Command |
| L | H | R6 | Last byte of DMA |
| L | L | R7 | SA test |

Figure 8-7. Read Timing Diagram

8-85. Address and register information is guaranteed valid while LIOSB is low or, in other words, LIOSB is the I/O bus clock. U36 causes LMYPA to go low whenever peripheral address 4 is addressed. If the access is a write to R5 (a command) the data is clocked into U10 and U24 (PCMD) via U45. A write to R7 (used only for SA testing) enables U14. Through U45, a write to any register other than R7 (DMA or command) enables U23 and U38. Whereas, a read from R4 or R6 (DMA) reads data from U22 and U37 (LRD).

8-86. U10B enables DMA upon command through R5 (PCMD). HDMAEN allows U9B to be set on the rising edge of $H D M A R Q$ from the state machine output U41. This generates a DMA request through U9B and U43C. An access through R6 (LR6), the last byte of DMA, clears the enable. This in turn, generates an interrupt (LIR3) through U6C, U34B, $U 44 A, B$ and $U 43 \mathrm{~A}$ indicating the end of a DMA cycle.

8-87. U26, U32 U42 and U41 comprise the controller state machine. U26 and U41, used to syncronize the state machine, are clocked by the normal and inverted outputs of a 2 MHz clock which runs asynchronously to the CPU clock. U32 and U42 are programmed ROMs. The purpose of the state machine is to interface between the CPU's 16 bit I/O bus and control bus, to U4's 8 bit bus. The state machine provides packing and and unpacking of words into Dytes thru the Mini Disc Controller internal registers when required (during DMA), and passing single bytes through without waiting for a second byte during commands.

8-88. U39 and U40 form a data control register. One example of this registers operation is as follows: During a read operation the Mini Disc Controller U4 is reading data from disc 0 and needs to write to disc 1 after its read routine is executed. First, the disc 0 drive operating conditions will be captured by the control latch U39. Then, the MDC will execute a read on disc 0 . After the read is done the control latch is loaded with the operating conditions for disc 1 via the data latches. Then, the MDC will execute a write on disc 1. The drive control buffer U40 is used for determining drive status and to provide a return path for SA stimulus.

8-89. U24, U25 and U10 form a drive status register that informs the system if the drives are operating, media has changed, write protected, requesting DMA, or the MDC, U4, has generated an interrupt.

8-90. U35 the DMA/CPU address selector is used to generate control signals for the internal data register of the Mini Disc Controller, U4.

8-91. U50 is used to detect that there is media in the drives and that the motor is turning. Index pulses will occur every 200 mS , which will keep the monostables retriggered. U51 detects a media change by monitoring the write protect switch.

8-92. U13, U1 and U3 are the final interface to the disc drives. Control and data signals are sent to U13 and U3 from U4 and control latch, U39. Status information from the drives is multiplexed by U1. The reason for multiplexing this information is that the Mini Drive Controller is designed for single drive operation.

8-93. The control board clock generation is done by the circuitry surrounding Y1, a 4 MHz crystal oscillator. R27, R28 and R29 bias U47C,D so the chip will operate in the linear region if the crystal is not oscillating. The crystal oscillates in the series-resonant mode.

Service - Model 64941A

8-94. MINI CONTROL DATA SEPARATOR.
(See service sheet 11C figure 8-13)
8-95. Due to the encoding scheme used, data from the disc drive consists of a train of pulses whose pulse-to-pulse spacing may be $4 u S$, $6 u S$ or $8 u S$. In practice, up to 200 nS of jitter may exist around these nominal values. The function of the data separation circuitry is to recover a clock from this data stream. Each block of data to be recovered is proceeded by a sync field consisting of 96 pulses spaced at $4 u S$ (12 bytes of 0 's).

8-96. U29 and U43B detect the presence of the sync field in the following manner: U29B counts a 2 MHz clock so if 5 uS or more elapses between sent pulses on pin 12, U29A will be reset by U43B. Since the sync field pulses occur at a nominal 4uS, U29A will count sync field pulses and QD will present a positive edge to U30 after 8, 24, 40 , 56 pulses. U30 QB and QD will transition from low to high after 24 (3 bytes) and 56 (7 bytes) pulses respectively. After $U 4$ has recognized four bytes of the sync field, it will set HRG high which will prevent U30 from being reset by the interpulse spaces of $6 u S$ and $8 u S$ which will occur in the data. However, HRG will be reset if an address mark is not found in 16 bytes or if the head is in the incorrect position.

8-97. U17, U18, U19, U11, U12 and U31 comprise a phase locked loop. U31, the VCO, runs at a nominal 500 KHz . When no data is being inspected off the disc, the PLL is locked to a 500 KHz reference in order to keep the loop in its active region. The DC voltage at TP1 should be within +- 2 V of ground under these conditions.

8-98. U18 is responsible for three operations. First, when no data is being inspected it will lock the VCO, U31, to the 500 KHz reference signal. Second, after U30 QB goes high U18 will lock the VCO to the 250 KHz signal while inspection is done of the sync field. Last, when U3O QD goes high the VCO is locked to the 4uS, 6uS, or 8uS data pulses.

8-99. U20, U21, and U17 cause an in phase switch between the 500 KHz reference and the sync field (these signals have a random phase relationship). Assume that U3O QB has just gone high: The next time U17 pin 9 transitions low, U20A will be clocked true. This will lock U17 pins 9 and 5 low (the PLL will be locked to the reference) and stop the VCO, U31. The second sync pulse which occurs after this will clock U21 true which will switch U18. Then, the sync field is presented to the PLL and the VCO is restarted in phase. The second sync pulse is the one necessary to insure that both halves of U31 have timed out before they are restarted.

8-100. U27A moves the data transition, either $1-0$ or $0-1$, to the center of each half bit cell. U27B then sets the data transition pulse width for U4.
$8-101$. The +12 V motor supply is provided by VR1, a voltage regulator, that uses the +17 V supply and converts it to +12 V . R25 and R26 provide the output voltage adjustment. CR3 and CR4 are used for protection to prevent C26 and C27, filter capacitors, from discharging through low current points in the regulator. +12 V motor, +5 V , and GND are distributed to the drives through J1 and J2.

8-102. MINI DRIVE THEORY OF OPERATION.
8-103. There is no theory-of-operation on the flexible disc drives at this time.

8-104. TROUBLESHOOTING.
8-105. This section contains troubleshooting information for the Flexible Disc Drive System when installed in the 64100A Logic Development Station. Contained are descriptions of each of the eight PV tests, descriptions of the PV error codes, the use of signature analysis, and service sheet layout.

8-106. PERFORMANCE VERIFICATION (PV) TEST DESCRIPTIONS (see paragraphs 8-108 thru 8-123).

8-107. The following is a description of each of the eight tests performed during a single performance verification (PV) test cycle.

8-108. FLOPPY CONTROLLER RESPONSE TEST.
8-109. During this test the CPU writes AA hex to the track register in the Mini Disc Controller chip and then reads it back and compares it. If this test fails Error message 14 (NO RESPONSE FROM DISC CONTROLLER) is displayed.

8-110. SELECT TEST. (SELECT will be in inverse video)

8-111. This test selects the drive to be tested, turns $O N$ the motor and checks for drive ready indication from the drive. If this test fails error message 1 (... DISC DOWN...) will be displayed.

8-112. TRACK 00 TEST.
(TRK 00 will be in inverse video)
8-113. This test issues a restore command to the drive and checks for the TRACK 00 indicator line to be active over track 0 and inactive over track 1. If this test fails error messages 2,3 , or 4 may be displayed. These are:

TRACK 00 INDICATOR ON OVER TRACK XX
TRACK 00 INDICATOR NOT ON OVER TRACK 0
TRACK 0 NOT FOUND

8-114. READ TRACK O TEST.
(RTRKO will be in inverse video)
8-115. This test reads all 16 sectors of track 0 on both sides of the disc. The possible error messages generated are message $1,5,6,, 7,8$ and 9 . These are:
...DISC DOWN...
LOST DATA:
DATA CRC ERROR:
ID CRC ERROR:
RECORD NOT FOUND:
SEEK ERROR:

TRK XX SEC XX SIDE X-R/W
TRK XX SEC XX SIDE X-R/W
TRK XX SEC XX SIDE X-R/W
TRK XX SEC XX SIDE X-R/W
TRK XX NOT VERIFIED

8-116. READ TRACK 34 TEST.
(RTRK34 will be in inverse video)
8-117. This test reads all 16 sectors of track 34 on both sides of the disc. The possible error messages generated are message 1, 5, 6, 7, 8 and 9. These are:
...DISC DOWN...
LOST DATA:
DATA CRC ERROR:
ID CRC ERROR:
RECORD NOT FOUND:
SEEK ERROR:

TRK XX SEC XX SIDE X-R/W
TRK XX SEC XX SIDE X-R/W
TRK XX SEC $X X$ SIDE $X-R / W$
TRK XX SEC XX SIDE X-R/W
TRK XX NOT VERIFIED

8-118. TRACK 34 CHECK TEST.
(The first READ after TRK 34: will be in inverse video)
8-119. This test checks track 34 to determine if it has been used. This is done by reading the data on track 34 , sector 0 on both sides. If the track is not used the data read will be all zeros. The possible error messages are 1, 5, 6, 7, 8, 9, 11, and 12. These are:
...DISC DOWN...
LOST DATA: TRK XX SEC Xx SIDE $\mathrm{X}-\mathrm{R} / \mathrm{w}$
DATA CRC ERROR: TRK XX SEC XX SIDE $X-R / W$
ID CRC ERROR:
TRK XX SEC XX SIDE X-R/W
RECORD NOT FOUND: TRK XX SEC XX SIDE $X-R / W$
SEEK ERROR: TRK XX NOT VERIFIED
READ KNOWN DATA ERROR: SIDE X
NO DISC SPACE AVAILABLE FOR WRITE TEST

8-120. TRACK 34 WRITE TEST.
(The WRITE after TRK 34: will be in inverse video)
8-121. This test writes to track 34 sector 1 on both sides of the disc. The error messages that can be generated are $1,5,6,7,8,9$, and 10 . These are:

```
...DISC DOWN...
LOST DATA:
DATA CRC ERROR:
ID CRC ERROR:
RECORD NOT FOUND:
SEEK ERROR:
NO WRITE--DISC PROTECTED
TRK XX SEC XX SIDE X-R/W
TRK XX SEC XX SIDE X-R/W
TRK XX SEC XX SIDE X-R/W
TRK XX SEC XX SIDE X-R/W
TRK XX NOT VERIFIED
```

8-122. TRACK 34 READ/VERIFY WRITE.
(The second READ after TRK 34: will be in inverse video)
8-123. This test reads the data written in the previous test and verifies that it is the same as the data written. The error messages that can be generated are 1, 5, 6, $7,8,9$, and 13. These are:
...DISC DOWN...
LOST DATA:
TRK XX SEC XX SIDE X-R/W
DATA CRC ERROR:
TRK XX SEC XX SIDE $X-R / W$
TRK XX SEC XX SIDE $X-R / W$
TRK XX SEC XX SIDE X-R/W
TRK XX NOT VERIFIED

RECORD NOT FOUND:
SEEK ERROR:
WRITE ERROR: SIDE X

8-124. PV ERROR MESSAGES.
8-125. While running the floppy PV test an error may be encountered and an error number given. Table 8-1 gives the error number to message conversion.

Table 8-1. Mini Floppy PV Error Messages
ERROR \#
ERROR MESSAGE

| 1 | .DISC DOWN. |
| :---: | :---: |
| 2 | TRACK 00 INDICATOR ON OVER TRACK XX |
| 3 | TRACK 00 INDICATOR NOT ON OVER TRACK 0 |
| 4 | TRACK O NOT FOUND |
| 5 | LOST DATA: TRK XX SEC XX SIDE X-R/W |
| 6 | DATA CRC ERROR: TRK XX SEC XX SIDE X-R/W |
| 7 | ID CRC ERROR: TRK XX SEC XX SIDE X-R/W |
| 8 | RECORD NOT FOUND: TRK XX SEC XX SIDE X-R/W |
| 9 | SEEK ERROR: TRACK XX NOT VERIFIED |
| 10 | NO WRITE--DISC WRITE PROTECTED |
| 11 | READ KNOWN DATA ERROR: SIDE X |
| 12 | NO DISC SPACE AVAILABLE FOR WRITE TEST |
| 13 | WRITE ERROR: SIDE X |
| 14 | NO RESPONSE FROM DISC CONTROLLER |
| 15 | not currently used |

When the current test passes a record of previous errors is displayed in the form of an error mask. A "1" is set in each of the bit positions corresponding to the ERROR \# of previous errors.

ERROR \# -> 15 --------------1
PREVIOUS ERROR MASK: XXXXXXXXXXXXXXX
For example, an error message reads:
PASSED PREV ERRORS: 000000001000001

This indicates that the present test passes but during one or more of the previous tests, errors occurred due to the disc being down (ERROR \#1) and ID CRC errors (ERROR \#7).

8-126. DESCRIPTION OF ERROR CODES AND TROUBLESHOOTING.
8-127. Table 8-2 is a description of each error code in table 8-1. Also, possible troubleshooting and corrective measures are listed.

Table 8-2. Description Of PV Error Codes.

CODE \#
DESCRIPTION
"...DISC DOWN..." This message indicates that the drive ready line of the disc being tested was not read in the true state.

Possible trouble/corrective measure:
a. No media in drive/Insert media and close door.
b. No index pulses from drive or motor not running/Check index pulse circuitry and servo motor.
c. Index pulses but no drive ready indication/Check drive ready circuitry.
d. Drive ready signal true on floppy control board/Check CPU interface with interface DSA loops.
"TRACK 00 INDICATOR ON OVER TRACK XX" This message indicates that the MDC was able to verify, by reading the ID portion of the track data, that the head was positioned over track XX. However, the CPU read the TRACK 00 status bit from the Mini Drive Controller (MDC) to be in the true state.

Possible trouble/corrective measures:
a. Go to DIAG mode (see section IV operation verification tests) and select correct drive and step to TRACK XX.
b. TRACK 00 signal is true at input to Mini Controller Chip (MDC)/Troubleshoot TRACK 00 detector circuitry, may have to do TRACK 00 switch adjustment.
c. TRACK 00 signal is false at input to MDC/Troubleshoot CPU interface circuitry with DSA interface loops.
"TRACK 00 INDICATOR NOT ON OVER TRACK 0 " This message indicates that it was verified by reading the ID portion of the track data, that the head was positioned over track 0 but the CPU read the TRACKOO status bit from the MDC to be in the false state.

Possible trouble/corrective measures:
a. Go to DIAG mode (see section IV operation verification tests) and select correct drive and restore it.
b. TRACKOO signal is false at input to MDC/Troubleshoot track 00 detector circuitry, may have to do a Track 00 switch adjustment.
c. TRACKOO is true at input to MDC/Troubleshoot CPU interface circuitry with DSA interface loops.
"TRACK 0 NOT FOUND" This message indicates that after the restore command the CPU read the TRACKOO indicator to be false and that the head was not positioned over track 0.

Possible trouble/corrective measures:
a. Go to DIAG mode (see section IV operation verification tests) and try the RESTORE command for the drive that failed.
b. Bad head positioning circuit/Check step and direction lines from the mini drive controller and stepper motor circuitry.
c. CPU interface to MDC bad/Check interface circuitry using DSA interface loops.
"LOST DATA TRK XX SEC XX SIDE X R/W" This message indicates that the CPU did not respond to either an interrupt or a DMA request from the mini drive controller. Also, that the data in the MDC was lost.

Possible trouble/corrective measures:
a. CPU interface to MDC is bad/Check interface circuitry using DSA interface loops.
b. DMA path to CPU bad/Check using logic probe or ohmmeter.
c. Mainframe interrupt circuitry bad/Troubleshoot with DSA in mainframe I/O write test.
"DATA CRC TRK XX SEC XX SIDE X R" This message is generated when the mini drive controller chip detects a CRC error in the data portion of a sector read operation.

Possible trouble/corrective measures:
a. Bad media/Reformat a new disc and repeat test.
b. Data separator circuit bad/Check using DSA data separator loops.
c. Bad drive read electronics/Check read data waveforms with the ones shown in the drive and drive head alignment procedures. See radial head alignment procedure in Section V, paragraph 5-19.
"ID CRC TRK XX SEC XX SIDE $\mathrm{X} R / \mathrm{W}$ " When this message is generated the MDC chip has detected a CRC error in the ID portion of a sector read operation.

Possible trouble/corrective measure:
a. Same as trouble/corrective measures used in code 6 above.
"RECORD NOT FOUND TRK XX SEC XX SIDE X R/W" This message is generated when the code for the desired track, sector, and side were not found on the current track in any of the ID fields.

Possible trouble/corrective measure:
a. Bad media/Reformat a new disc and repeat test.
b. Data separator circuit bad/Check using DSA data separator loops.
c. Bad Drive Electronics/Check the read data waveforms with the waveforms given in the drive and drive head alignment procedures given in Section V.
d. Bad head positioning circuit/Check the step and direction lines from the mini drive controller and stepper motor circuitry.
"SEEK ERROR: TRK XX NOT VERIFIED" When this message is generated the code for the desired track is not found in the ID field.

Possible trouble/corrective measure:
a. The trouble and corrective measures are the same as code 8 above.
"NO WRITE DISC WRITE PROTECTED" This message is generated when the CPU reads the write protect line (through the activity register) for the selected drive in the true state during a write operation.

Possible trouble/corrective measure:
a. Disc write protected/Use disc that is not write protected.
b. The write protect signal is true when the disc is not write protected/Troubleshoot the write protect circuitry.
c. Write protect line operates correctly, but, the CPU interface is bad/Check CPU interface using DSA with activity buffer moved to mode buffer location.
"READ KNOWN DATA ERROR: SIDE X" When the data read on track 34 , during the track 34 check, is not all zeros then an error is displayed.

Possible trouble/corrective measure:
a. Bad media/Reformat a new disc and perform test again.
b. Data separator circuit bad/Check using DSA data separator loops.
c. Bad drive read electronics/Check the read data waveforms with the waveforms given in the drive and head alignment procedures given in Section V.
d. Bad head positioning circuit/Check step and direction lines from the mini drive controller and stepper motor circuitry.
"NO DISC SPACE AVAILABLE FOR WRITE TEST" This message is generated when the first byte of data read on track 34 , during the track 34 check, is not all zeros.

Possible trouble/corrective measure:
a. The trouble and corrective measures are the same as code 11 above.
"WRITE ERROR: SIDE X" When the data written to track 34 during the track 34 write test does not match the data read back during the track 34 read/verify test this message will be generated.

Possible trouble/corrective measure:
a. Bad media/reformat a new disc and perform the test again.
b. Bad write circuitry/check write gate, write data, and write protect signals to the MDC and the write waveforms to the drive units.
"NO RESPONSE FROM DISC CONTROLLER" This message is generated when the CPU cannot write 55 Hex to the track register in the Mini Drive Controller and read it back correctly.

Possible trouble/corrective measure:
a. CPU interface to MDC bad/check interface circuitry using DSA interface loops.

8-128. TROUBLESHOOTING USING SIGNATURE ANALYSIS (SA).
8-129. Signature analysis may be used to troubleshoot the Mini Control board to component level. Signature analysis is a technique that enables the signature analyzer to display a compressed, four digit "fingerprint" or signature of the data stream at a given node. Any fault associated with a device on that node will force a change in the data stream and, therefore, result in an erroneous signature.

8-130. Do the following when troubleshooting the flexible disc drive system: first, configure the Rear-Panel switches to the PV mode or press CONTROL/RESET simultaneously (figure 4-1 should appear); second, press the DIAG softkey figure 4-2 should appear). This will give access to the floppy disc diagnostic menu. This menu consists of two signature stimulus loops, DSA1 and DSA2. DSA1 starts the CPU interface DSA loop. DSA2 starts the data separator DSA loop. SA tables 86 thru $8-18$ are represented by a black letter at a given node that correlates to the letter given with the SA table. For example, Table 8-6, Loop A. The black letter "A" is given on the schematic where loop A signatures can be taken.

## 8-131. KEY SIGNATURES.

8-132. While using SA on the Floppy Control Board, some of the loops may contain key signatures. Using the key signatures should reduce troubleshooting time. A key signature is indicated with a " + " next to the node on the SA table and will be a red shaded black letter on the service sheet. The key signatures should be checked before doing all of that loop. If the key signatures are good, then the rest of the signatures in that loop are good.

8-133. INTERFACE LOOP.
8-134. The SA tables for the interface loop contain key signatures. However, key signatures in loops $A, B$ and $M$ should be taken first. If all of the key signatures are good, then no more signatures need to be taken in the interface loop. Although, if some of the key signatures in loops $A, B$ and $M$ are wrong, then performing other SA loops may be necessary to fix a problem.

8-135. In the interface loop, SA tables $A-J$ are used to exercise the CPU/MDC interface circuitry. In this loop, test jumper E2 must be in the interface TEST position, XU15. This connects the output of the SA stimulus latch to the inputs of DMA state machine. This allows the CPU to directly control the state machine. Also, the clock for the state machine is connected to LMYPA so that the state machine is clocked only when the CPU communicates with register 4 . This makes all interface circuitry synchronous with the CPU and thus allows SA. SA tables A-J are outlined below:

Table A -- Check overall interface
Table B -- Check Floppy ASM
Table M -- Check all Data (I/O Bus) to/from Floppy Controller
Table C -- To check I/O bus decoding
Table D -- Check Data written to Floppy drives

Table E -- Checks Floppy Read Latches

Table F -- Check Data out of U23
Table G -- Check Data from U38

Table H -- Check Data from mode buffer U40
Table I -- Check Data from the MDC (MSB)
Table J -- Check Data from the MDC (LSB) and from U40

8-136. DATA SEPARATOR LOOP.
8-137. In this loop, test jumper E1 must be in the Data Separator TEST position, XU7. This connects the output of the SA latch to the data separator inputs. Also, LMYPA is connected to the L2MHZ input to the data separator. This makes all of the data separator circuitry synchronous to the CPU and thus allows for SA. SA tables K and $L$ are outlined below:

Table K -- Check Data Separator circuitry
Table L -- To check U18 multiplexer to make sure it is multiplexing the HDATA1US signal properly. There are no signature nodes for this loop. just check for correct VH.

8-138. SERVICE SHEET LAYOUT.
8-139. Each service sheet shows the circuitry that controls each of the functional areas listed in table 8-3. Reduced block diagrams and component locators are given with each service sheet. These are gray shaded to correlate the general relationships of the particular circuitry to the overall system.

8-140. MINI CONTROL AND DRIVE SERVICE SHEET LAYOUT.
8-141. The circuitry for the mini control board is shown on service sheets 11A-11C and the circuitry for the mini drives is shown on sheets 1 and 2. Refer to table 8-3 for a list of service sheets and the functional circuitry shown on each sheet.

Table 8-3. Service Sheet To Function

8-142. LOGIC CONVENTION.
8-143. The positive logic convention is used for the circuits of the 64941A floppy drive option. Positive logic defines a logic 1 as a more positive voltage (high) and a logic 0 as the more negative voltage (low). Ideally, the low and high voltage levels are $0 V$ and +5 V , respectively. Actual levels may vary from these ideal values. Therefore, the voltage levels for a logic 1 and 0 are defined as follows:

TTL Voltage Levels
Binary Quantity Voltage Limit

| Input 0 | $<0.8 \mathrm{~V}$ |
| :--- | :--- |
| Input 1 | $>2.0 \mathrm{~V}$ |
| Output 0 | $<0.4 \mathrm{~V}$ |
| Output 1 | $>2.4 \mathrm{~V}$ |

8-144. LOGIC SYMBOLOGY.
8-145. Table $8-4$ gives a summary of the logic symbology used in this manual.

Table 8-4. Logic Symbology

## GENERAL

All signals flow from left to right, relative to the symbol's orientation with inputs on the left side of the symbol, and outputs on the right side of the symbol (the symbol may be reversed if the dependency notation is a single term .

All dependency notation is read from left to right (relative to the symbol's orientation).
An external state is the state of an input or output outside the logic symbol
An internal state is the state of an input or output inside the logic symbol. All internal states are True $=$ High.

## SYMBOL CONSTRUCTION

Some symbols consist of an outline or combination of outlines together with one or more qualifying symbols, and the representation of input and output lines.

Some have a common Control Block with an array of elements

CONTROL BLOCK - All inputs and dependency notation affect the array elements directly. Common outputs are located in the control block. (Control blocks may be above or below the array elements.)

ARRAY ELEMENTS -All array elements are controlled by the control block as a function of the dependency notation. Any array element is independent of all other array elements. Unless indicated, the least significant element is always closest to the control block. The array elements are arranged by binary weight. The weights are indicated by powers of 2 (shown in [ ]).

Table 8-4. Logic Symbology (Cont'd)
INPUTS - Inputs are located on the left side of the symbol and are affected by their dependency notation.
Common control inputs are located in the control block and control the inputs/outputs to the array elements according to the dependency notation

Inputs to the array elements are located with the corresponding array element with the least significant element closest to the control block.

OUTPUTS - Outputs are located on the right side of the symbol and are effected by their dependency notation. Common control outputs are located in the control block.

Outputs of array elements are located in the corresponding array element with the least significant bit closest to the control block.

## CHIP FUNCTION - The labels for chip functions are defined, i.e., CTR - counter, MUX - multiplexer

## DEPENDENCY NOTATION

Dependency notation is always read from left to right relative to the symbol's orientation.
Dependency notation indicates the relationship between inputs, outputs, or inputs and outputs. Signals having a common relationship will have a common number, i.e., $\mathrm{C7}$ and 7D....C7 controls D. Dependency notation $23.5+/ 1 \mathrm{C} 7$ is read as when 2 and 3 and 5 and 6 are true the input will cause the counter to increment by one count or (/) the input (C7) will control the loading of the input value (7D) into the D flip-flops.

The following types of dependencies are defined:
a. AND (G), OR (V), and Negate (N) denote Boolean relationship between inputs and outputs in any omb
b. Interconnection ( $Z$ ) indicates connections inside the symbol.
c. Control (C) identifies a timing input or a clock input of a sequential element and indicates which inputs are controlled by it
d. Set $(S)$ and Reset ( $R$ ) specify the internal logic states (outputs) of an RS bistable element when the R or $S$ input stands at its internal 1 state.
e. Enable (EN) identifies an enable input and indicates which inputs and outputs are controlled by it (which outputs can be in their high impedance state).
f. Mode ( $M$ ) identifies an input that selects the mode of operation of an element and indicates the inputs and outputs depending on that mode
g. Address (A) identifies the address inputs.
h. Transmission ( X ) identifies bi-directional inputs and outputs that are connected together when the transmission input is true

## ependency notation symbols

| A | Address (selects inputs/outputs) (indicates binary range) | N | Negate (compliments state) |
| :--- | :--- | :--- | :--- |
| C | Control (permits action) | R | Reset Input |
| EN | Enable (permits action) | S | Set Input |
| G | AND (permits action) | V | OR (permits action) |
| M | Mode (selects action) | Z | Interconnection |
|  |  | X | Transmission |

LS-08-09-82-2

## OTHER SYMBOLS

| $\bigcirc$ | Analog Signal | $\Delta \Delta$ | Inversion |  | Shift Right (or down) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| \& | AND | O | Negation | / | Solidus (allows an input or output to have more than one function) |
| $\}\{$ | Bit Grouping | $\cdots$ | Nonlogic Input/Output | $\nabla$ | Tri-State |
|  | Buffer | $\Delta$ | Open Circuit (external resistor) |  |  |
| $!$ | Compare | $\nabla$ | Open Circuit (external resistor) | , | Causes notation and symbols to effect inputs/outputs in an AND relationship, and to occur in the order read from left to right. |
|  | Dynamic | $\geq 1$ | OR |  |  |
| $=1$ | Exclusive OR | $\bar{\nabla}$ | Passive Pull Down (internal resistor) | ( ) | Used for factoring terms using algebraic techniques. |
| T1 | Hysteresis | $\theta$ | Passive Pull Up (internal resistor) |  | Information not defined. |
| $?$ | Interrogation |  | Postponed | $\Phi$ | Logic symbol not defined due to complexity. |
| - | Internal Conne |  | Shift Left (or up) |  |  |

## MATH FUNCTIONS

| I. | Adder |
| :--- | :--- |
| ALU | Arithmetic Logic Unit |
| COMP | Comparator |
| DIV | Divide By |
| $=$ | Equal To |

| $>$ | Greater Than |
| :--- | :--- |
| $<$ | Less Than |
| CPG | Look Ahead Carry Generntor |
| $\pi$ | Multiplier |
| P-Q | Subtractor |

## CHIP FUNCTIONS

| BCD | Binary Coded Decimal | DIR | Directional | RAM | Random Access Memory |
| :--- | :--- | :--- | :--- | :--- | :--- |
| BIN | Binary | DMUX | Demultiplexer | RCVR | Line Receiver |
| BUF | Buffer | FF | Flip-Flop | ROM | Read Only Memory |
| CTR | Counter | MUX | Multiplexer | SEG | Segment |
| DEC | Decimal | OCT | Octal | SRG | Shift Register |

## DELAY and MULTIVIBRATORS

| $\Omega \Omega$ | Astable |
| :--- | :--- |
| 100 ns | Delay |
| $\square$ | Nonretriggerable Monostable |
| NV | Nonvolatile |
| $\square$ | Retriggerable Monostable |

LS-08-09-82-3

8-146. MNEMONICS.
8-147. Signals in the 64941A flexible disc drive option have been assigned mnemonics that describe the active state and function of the signal (see table 8-4). A prefix letter ( $\mathrm{H}, \mathrm{L}, \mathrm{P}$, or N ) is used to indicate the active state of the signal and the remaining letters indicate its function $A$ " H " prefix indicates that the function is active in the "high" state; a "L" prefix indicates that the function is active in the "low" state; a "P" prefix indicates the clock signal is active on the positive edge of the clock; a " $N$ " indicates the clock is active on the negative edge of the clock. Table 8-5 is a listing of the mnemonics used on the service sheets.

Table 8-5. Mnemonics

MNEMONIC
DESCRIPTION

DSO-3 Drive Select 0 through 3.
When low, the drive is selected and will respond to step or read/write commands. This system uses DSO only.

HA 0-1 High Address 0-1.
These inputs in conjunction with the chip select and write inputs select between the status register, track register, sector register, data register and command registers internal to the Mini Disc Controller chip.

HBYTE 3 High Byte 3.
When true, this signal indicates that three consecutive bytes of zeros or ones have been received from the disc.

HBYTE $7 \quad$ High Byte 7.
When true, this signal indicates that seven consecutive bytes of zeros or ones have been received from the Flexible Disc Drive electronics.
hDATAIUS High Data 1 Microsecond.
This signal pulses true for 1 microsecond whenever a flux transition is detected from the disc drive.

HDIRC

HDMAEN
High Direction.
When high the heads are stepped out (away from center) and when low the heads are stepped in with each step pulse.

High DMA Enable.
This signal is set true by the CPU when it is ready for a DMA operation. This signal is set to the false state when the DMA operation is completed.

| HDMARQ | High DMA Request. <br> Signal from CPU Interface/DMA state machine that indicates that the Mini Disc Controller chip is requesting a DMA cycle. |
| :---: | :---: |
| HDRQ | High Data Request. <br> When high, indicates that the Mini Disc Controller's data register is full, if a read operation is occurring, or empty during a write operation. This line is cleared when the CPU does a read or write to the data register. |
| HINHIBIT | High Inhibit. <br> Signal in data separator circuitry which halts the vCO during a sink-up cycle. When this signal goes to the false state, the VCO is again started in phase with incoming data. |
| HMDCRQ | High Mini Disc Controller Request. <br> HMDCRQ is a signal from Mini disc Controller chip which, when true, indicates that the Mini Disc Controller chip wishes to interrupt the CPU operation. |
| HR5,6 | High Register 5, 6. <br> When in the true state indicates that the CPU is communicating with the Mini Disc Controller via either register 5 or register 6 internal to the CPU. The state of the registers is determined by LIC1 and LIC2. |
| HRCLK | High Read Clock. <br> Clock signal from data separator circuitry which is in phase with the LRAWRD signal. |
| HRG | High Read Gate. <br> Signal from the Mini Disc Controller chip which indicates to the data separator circuitry that a field of zeros or ones has been encountered. When true, it does not allow the data separator to re-synchronize. |
| HSA D0-7 | High Signature Analysis Data 0-7. <br> These signals are the outputs of the SA stimulus latch. The lower byte of the LIOD ( $0-7$ ) bus is used by the CPU to make the interface and data separator circuitry synchronous with the CPU. |
| HVCOE | High Voltage Control Oscillator Enable. Complement of LVCOE. |

Table 8-5. Mnemonics (Cont'd)

MNEMONICS
DESCRIPTION

| H2MHZC | High 2 MHz Clock. <br> The inverted 2 MHz clock used to clock data from the output of the state machine. |
| :---: | :---: |
| LAO-2 | Low Address 0-2. <br> Address bits from CPU which are used to select the address of the Mini Disc Controller chip or other registers in which read and write operations are to occur. |
| LBEN | Low Buffer Enable. <br> When low, this signal enables the drive status buffers and also resets the processor request flip-flop. |
| LCS | Low Chip Select. <br> Input signal from the CPU which enables the Mini Disc Controller chip. |
| LCRMCO, 1 | Low Clear Media Change 0, 1. <br> These signals clear their respective media change flip-flops, and are controlled by the CPU. |
| LDAL 0-7 | Low Data Access Lines 0-7 <br> Bi directional lines that carry data and commands to and from the Mini Disc Controller chip, drive status register, etc. |
| LDMAAK | Low DMA Acknowledge. <br> Signal to the CPU interface state machine which indicates that the DMA request from the Mini Disc Controller has been acknowledged. |
| LDMAEN | Low DMA Enable. Complement of HDMAEN. |
| LDMAI | Low Direct Memory Access Interrupt. <br> An interrupt to the CPU when the MDC is requesting DMA and LDMAEN is not true. |
| LDMAR | Low Direct Memory Access Request. <br> When low, indicates to the CPU that the MDC wants direct access to memory. |
| LDOUT | Low Data Out. <br> Signal from CPU which indicates read or write operation on the <br> I/O bus (Low $=$ Write). This is valid when LIOSB is low. |

Table 8-5. Mnemonics (Cont'd)

| LDRQ | Low Data Request. Complement of HDRQ . |
| :---: | :---: |
| LIC1-2 | Low Interface Control 1 and 2. <br> These lines can provide up to four states used to control peripheral devices. How these lines are controlled is determined by software. |
| LINT | Low Interrupt. <br> The microprocessor pulls this line low to poll the Input/Output Bus to determine which peripheral device requested the interrupt. |
| LIODO-15 | Low Input/Output Data 0 through 15. <br> The LIOD bus is a bi-directional bus. The CPU uses this bus to communicate with I/O ports. Information is low true, and is used in conjunction with LPABO-3. |
| LIOSB | Low Input/Output Strobe. <br> When this signal goes from low to high, the data on the $1 / 0$ bus is valid. |
| LIR3 | Low Interrupt Request 3. <br> Interrupt request from Mini Controller board to the interrupt circuitry on the I/O board that the mini controller is in need of service by the CPU. |
| LLL | Low Latch Least. <br> Signal from CPU interface state machine which latches the least significant byte of data during a CPU read cycle. |
| LLM | Low Latch Most. <br> Signal from CPU interface state machine which latches the most significant byte of data during a CPU read cycle. |
| LMDCI | Low Mini Disc Controller Chip Interrupt. <br> Flag signal to CPU that indicates that the Mini Disc Controller chip is currently requesting an interrupt. |
| LMCIR | Low Media Change Interrupt Request. <br> Interrupt signal from media change flip-flops indicating that media has been changed on the disc. |
| LMDCHGO,1 | Low Media Change 0,1 . <br> When low, the corresponding signal indicates that the media has been changed on the appropriate disc. |

Table 8-5. Mnemonics (Cont'd)

MNEMONICS
DESCRIPTION

| LMR | Low Master Reset. <br> Input to the Mini Disc Controller chip, when true, resets internal status registers. |
| :---: | :---: |
| LMDCRQ | Low Mini Disc Controller Request. Complement of $\operatorname{HMDCRQ}$. |
| LMYPA | Low My Peripheral Address. <br> Goes low when the CPU is communicating with the mini drive circuitry. This signal is formed when Peripheral Address 4 is accessed by the CPU. Also, LMYPA is used as the clock during SA. |
| LNTRDYO,1 | Low Not Ready 0,1 <br> When true, these signals indicate that the corresponding disc drive is not ready, i.e, index pulses have dropped below a specified rate. |
| LOEL | Low Output Enable Lower. <br> When true, this signal enables the least significant 8 bits of data to appear on the disc interface bus during a microprocessor write cycle. |
| LOEM | Low Output Enable Most. <br> When true, this signal enables the 8 most significant bits to the disc interface bus during a microprocessor write cycle. |
| LPOP | Low Power On Pulse. <br> This signal pulses low when power is cycled. When pulsed low, it will initialize and reset the CPU and mini drive control circuitry. |
| LPOPB | Low Power On Pulse Buffered. <br> When low, resets drive and interface control latches. |
| LPAO-3 | Low Peripheral Address 0 through 3. <br> Identifies which one of the 16 peripheral devices will be involved in a I/O operation. |
| LPRQ | Low Processor Request. <br> When true, this signal indicates that the CPU is requesting a cycle from the the CPU interface/DMA state machine. |
| LRAWRD | Low Raw Read. <br> Signal which enables a read data cycle from the data separator circuitry and is in phase with HRCLK. |

Table 8-5. Mnemonics (Cont'd)

MNEMONICS
DESCRIPTION

| LR7 | Low Register 7. <br> When true, this signal indicates that the CPU is communicating on the $I / O$ bus through register 7 . |
| :---: | :---: |
| LRDDATA | Low Read Data. <br> When true, indicates to the data separation circuitry that a flux transition has occurred on the disc. |
| LRD | Low Read. <br> When true, this signal indicates that the microprocessor is executing a read cycle from the Mini Disc Control circuitry through the data latches. |
| LRST | Low Reset. <br> Signal from the microprocessor which resets the Mini Disc Controller circuits. |
| LRSTINT | Low Reset Interrupt. <br> Signal from the microprocessor. When true, it resets the Mini Disc Controller chip interrupts and DMA interrupt request flip-flops. |
| LVCO | Low Voltage Control Oscillator. Low true output of VCO oscillator. |
| LVCOE | Low Voltage Control Oscillator Enable. <br> Signal from Mini Disc Controller chip which is made true when the Mini Disc Controller is inspecting data coming from the disc. When true, enables data separator circuitry. |
| LWE | Low Write Enable. <br> Signal to Mini Disc Controller chip which enables write circuitry in conjunction with Low Chip Select (LCS). |
| LWRT | Low Write. <br> When true, corresponding signal indicates that the CPU is executing a write to the mini disc circuitry through the data latches. |
| LWRTSM | Low Write State Machine. <br> Signal from microprocessor which indicates whether a read or write operation should be executed during the next CPU/DMA state machine interface cycle. |
| LWPRT0,1 | Low Write Protect 0,1. <br> When true, corresponding signal indicates that the disc installed in the disc drive is write protected. See Write Protect. Also, used to set corresponding media change flipflop. |

Table 8-5. Mnemonics (Cont'd)

MNEMONICS
DESCRIPTION

| LRE | Low Read Enable. <br> Input to Mini Disc Controller chip which enables read <br> circuitry in conjunction with Low Chip Select (LCS). |
| :--- | :--- |
| L2MHZ | Low 2 MHz. |
|  | 2 MHz signal derived from the 4 MHz oscillator circuit. |

Table 8-5. Mnemonics (Cont'd)

| SIDE ONE | A high logic level selects the side " 0 " read/write head and <br> a low logic level selects the side " 1 " read/write head. |
| :--- | :--- |
| SELECT |  |$\quad$| Pulses low to step the head in or out. Direction is controlled |

| by HDIRC. |

8-148. TROUBLESHOOTING HINTS.
8-149. The following are some things to check before troubleshooting the Mini Control board.
a. Make sure the clocks on U26 pin 11 and U41 pin 11 are clocking at 2 MHz .
b. Check that U36 pin 12 (LMYPA) is toggling. This indicates that the CPU is working and communicating with the Mini Disc Controller.
c. The CPU will not work at all if LIR3 or LDMAR are pulled low at the wrong time. $U 43$ may be removed to disable these signals.
d. To isolate a problem to a drive, swap the drive control cables (A9W1 and A10W1) and see if the symptom changes from one drive to the other.
e. If both drives fail, the problem is probably on the Mini Control board.
f. If the problem is on the Mini Control board (A11) and no bad signatures are found, and the data separator is good then check the signals that go between the Mini Disc Control (MDC U4) and the drives using diagnostic mode (DIAG).
g. Test STEP and RESTORE commands before a READ or WRITE to disc. These require that a lot less circuitry be functional.
h. The phase detector U19 locks the NEGATIVE transitions of "vCO Data" and "VCO OSC" together.
i. For a simple analysis, consider U12 to be an integrator.
j. Check that the VCO will lock to the 500 KHz reference record.

8-150. To completely check the Data Separator Circuitry perform the following checks in the order given:

1) Set-up SA loop $K$ and check the following key signatures:
```
U11-1 7CA3
U11-2 7CA3
U11-6 55AP
U11-7 55AP
```

IF FAILURE - Use SA loop K to isolate problem.
2) Set-up SA loop L and check the following:
$\mathrm{VH}=72 \mathrm{~A} 2$
IF FAILURE - Check for 1uS pulses on U18 pins 11 and 13. If good then replace U18.

Waveform at TP1 is correct. (schematic 11C).
IF FAILURE - Check components in Intergrator and Phase Detector circuits. (schematic 11C)

Pulse width (low) at TP4 (U27A pin 4) is $1 u S+-50 n S$.
IF FAILURE - Check U27A, R20 and C33.

Pulse width (high) at U4 pin 27 is $170 \mathrm{nS}+-20 \mathrm{nS}$.
IF FAILURE - Check U27B, R21 and C34.
3) Return instrument to normal operating configuration and check for 2 MHz square wave (period $500 \mathrm{nS}+-25 \mathrm{nS}$ ) at U 29 B pin 13 and for 500 KHz square wave (period $2 \mathrm{uS}+-100 \mathrm{nS}$ ) at U17 pin 13.

IF FAILURE - Check oscillator circuit on schematic 11B.
4) Short TP1 to ground and check TP5 for a period of $1.9 \mathrm{uS}+-100 \mathrm{nS}$ with asymmetry less than $5 \%$ and $U 4$ pin 26 for 250 KHz square wave.

IF FAILURE - Check U31A,B, R10,11,22,23, C15 and C20.

8-151. The following are some specification that should be tested before troubleshooting.
a. 44 pin 24
b. U50 pins 5 and 13
c. U27 pin 13

U27 pin 12
d. U31 pin 4

U31 pin 13 with TP1 grounded
e. TP1 PLL locked to 500 KHz
reference reference
period $=2 u S+-100 \mathrm{nS}$
asymmetry of square wave $<=5 \%$
$1 \mathrm{MHz}+-1 \%$ square wave
$225 \mathrm{mS}<=\mathrm{PW}<=300 \mathrm{mS}$
$1 \mathrm{uS}+-50 \mathrm{nS}$
$150 \mathrm{nS}<=\mathrm{PW}<=190 \mathrm{nS}$
$+-2 V$ of ground
