## Printing History

New editions of this manual will incorporate all material updated since the previous edition. Update packages may be issued between editions and contain replacement and additional pages to be merged into the manual by the user. Each updated page will be indicated by a revision date at the bottom of the page. A vertical bar in the margin indicates the changes on each page. Note that pages which are rearranged due to changes on a previous page are not considered revised.

The manual printing date and part number indicate its current edition. The printing date changes when a new edition is printed. (Minor corrections and updates which are incorporated at reprint do not cause the date to change.) The manual part number changes when extensive technical changes are incorporated.

January 1982...First Edition
| April 1984...Second Edition. Updated pages.

## Warranty Statement

Hewlett-Packard products are warranted against defects in materials and workmanship. For Hewlett-Packard Fort Collins Systems Division products sold in the US.A. and Canada, this warranty applies for ninety ( 90 ) days from the date of delivery. Hewlett-Packard will, at its option, repair or replace equipment which proves to be defective during the warranty period This
 shipped freight prepaid. Repairs necessitated by misuse of the equipment, or by hardware, software, or interfacing not provided by Hewlett-Packard are not covered by this warranty

HP warrants that its software and firmware designated by HP for use with a CPU will execute its programming instructions when properly installed on that CPU. HP does not warrant that the operation of the CPU. software, or firmware will be uninterrupted or error free

HEWLETT-PACKARD MAKES NO WARRANTY OF ANY KIND WITH REGARD TO THIS MATERIAL, INCLUDING, BUT NOT LIMITED TO. THE IMPLIED WARRANTIES OF MERCHANTABLITY AND FITNESS FOR A PARTICULAR PURPOSE. HewlettPackard shall not be liable for errors contained herein or for incidental or consequential damages in connection with the furnishing, performance or use of this material
*For other countries. contact your local Sales and Support Office to determine warranty terms

## 9845B/C Mainframe Product Information

## Chapter 1

## 9845B/C Computer Specifications

The following specifications are common to both the System 45B and 45C.
COMPUTATIONAL

| Memory |  |
| :---: | :---: |
| Dynamic Range . . . . . . . . | $\begin{aligned} & -10^{99} \text { to }-10^{-99}, 0, \\ & +10^{-99} \text { to }+10^{99} \end{aligned}$ |
| Internal Calculation |  |
| Range. | $\begin{aligned} & -10^{511} \text { to }-10^{-511}, 0, \\ & +10^{-511} \text { to }+10^{511} \end{aligned}$ |
| Tape Cartridge |  |
| Capacity (per cartridge) | 217000 bytes |
| Access | directory (stored in $\mathbf{r} / \mathbf{w}$ memory), file-by-name |
| Search Speed (bidirectional) | $2286 \mathrm{~mm} / \mathrm{s} .(90 \mathrm{in} / \mathrm{s}$.) |
| Average Access Time. | 6 s . |
| Average Transfer Rate . | 1440 byte/s. |
| Rewind Time | 19 s . (end to end) |
| Cartridge Size. | $\begin{aligned} & 63.5 \times 82.5 \times 12.7 \mathrm{~mm} \\ & (2.5 \times 3.25 \times 0.5 \mathrm{in} .) \end{aligned}$ |
| Read/write |  |
| Verification | program recording |
| Error Check | check sum |

Note: Tape cartridges are intended for nominal program or data storage; the typical life cycle is $50-100$ hours of use, depending upon the application. It is suggested that tape transports be cleaned regularly and tape cartridges removed from drives after use.

THERMAL LINE PRINTER
Printing Speed . . . . . . . . . . . . . . . . . . . up to 480 lines/minute
Plotting Speed:

| CR |  |  |
| :---: | :---: | :---: |
|  |  |  |
|  |  |  | 3.5 to $25 \mathrm{~mm} / \mathrm{s}$. ( 0.14 to $1 \mathrm{in} . / \mathrm{s}$.)

Character Matrix . . . . . . . . . . . . . . . $5 \times 7$ dots ( $7 \times 12$ field)
Noise Level:
9 hours@ $100 \%$ duty cycle .... 68 dba (max.)
0.5 hours @ 100\% duty cycle..... 55 dba (avg.)

Paper Feed . . . . . . . . . . . . . . . . . . . . . automatic load
Paper Dimensions:
English version . . . . . . . . . . . . . . $216 \mathrm{~mm} \times 61 \mathrm{~m}$ ( 8.5 in . x 200 ft .)
Metric version ................ $210 \mathrm{~mm} \times 60 \mathrm{~m}(8.27 \mathrm{in}$. $\times 197 \mathrm{ft}$.)
Paper Types . . . . . . . . . . . . . . . . . . . . black print, perforated blue print, continuous roll
Note: The 9845 printer is designed to print approximately 50000 Ft . of paper (about 250 rolls) prior to print head replacement. However, actually print head life may vary widely depending upon usage.

The following specifications vary between the HP 9845B and HP 9845C.

| SPECIFICATIONS | HP 9845B (with standard processor and CRT) | HP 9845B (with enhanced processor and CRT) | HP 9845C |
| :---: | :---: | :---: | :---: |
| ALPHA RASTER SIZE | $\begin{aligned} & 236 \times 122.94 \mathrm{~mm}(9.3 \times 4.84 \\ & \text { in. }) \end{aligned}$ | $236 \times 149 \mathrm{~mm}(9.3 \times 5.9 \mathrm{in}$. | $247 \times 154 \mathrm{~mm}$ (9.72 $\times 6.06 \mathrm{in}$.) |
| SCREEN CAPACITY | 26 lines x 80 characters ( 2080 characters) | 26 lines $\times 80$ characters (2 080 characters) | 26 lines $\times 80$ characters <br> ( 2080 characters) |
| DOT SPACING | 0.328 mm (0.013 in.) | 0.328 mm (0.013 in.) | $0.343 \mathrm{~mm}(0.0135 \mathrm{in}$. |
| GRAPHICS MODE <br> Raster Size Display Speed | $200 \times 162.5 \mathrm{~mm}$ ( $7.9 \times 6.4 \mathrm{in}$.) | $184 \times 149 \mathrm{~mm}$ ( $7.2 \times 5.8 \mathrm{in}$. | $192 \times 156 \mathrm{~mm}$ ( $7.5 \times 6.1 \mathrm{in}$. |
| (Vectors/s., overlapped and not clipped) |  |  | Opt. 100 Opt. 200 |
| For/Next | $\sim 50$ | $\sim 270$ | $\sim 95 \sim \sim 145$ |
| Matrix Plot | N.A.t | $\sim 430$ | $\sim 200 \sim 240$ |
| Absolute Plot | N.A.t | $\sim 5000$ | $\sim 5000 \sim 5000$ |
| Circles/s., not clipped | N.A. $\dagger$ | $\sim 240$ | $\sim 2 \sim 5$ |
| Linearity | 1.5\% full screen |  |  |
| Array Size | $560 \times 455$ dots | $560 \times 455$ dots | $560 \times 455$ dots |
| Dot Resolution | 0.357 mm ( 0.014 in .) | 0.33 mm ( 0.013 in .) | 0.034 mm ( 0.013 in .) |
| CURSOR |  |  |  |
| Plotting Mode | Full screen or blinking crosshair | Full screen or blinking crosshair | Full screen or small crosshair |
| Letter Mode | Blinking underline | Blinking underline | Blinking underline |
| Character Editing | Overstrike in letter mode | Overstrike in letter mode | Overstrike in letter mode |

## HP 9845 Computer Option Information

Both the System 45B and the System 45C are available in expanded, standard and minimum configurations. The expanded configuration has been designed to handle even the most demanding computation, design or I/O applications. The standard configuration has been selected as the system that will best meet most computer needs. The minimum configuration contains those features that are part of every 9845B and 9845C.

| Features <br> Features included with unit/option | HP 9845C Expanded 190270290 |  |  | HP 9845B Expanded 190270290 |  |  | HP 9845C <br> Standard <br> 150250 |  | HP 9845B <br> Standard <br> $150 \quad 250$ |  | HP 9845C Minimum 100200 |  | HP 9845B Minimum 100200 |  |

*Can be upgraded with memory options.
Note: Minimum and Standard systems can be upgraded to Expanded systems.

Field Installed Options

| Product No. | Description |
| :---: | :---: |
|  | READ/WRITE MEMORY |
| 98425A | 130880 bytes incremental |
| 98426A | 261760 bytes incremental |
| 98427A | 392640 bytes incremental |
| Opt. 207 | 512 K bytes of RAM. May be ordered in quantities of one or two. |
|  | READ ONLY MEMORIES |
| 98411A | Graphics ROM (9845B Opt. 100 only) |
| 98412A | I/O ROM |
| 98413A | Mass Storage ROM |
| 98414A | Advanced Programming ROM |
| 98415A | Structured Programming ROM |
| 98417A | BASIC Datacomm ROM |
| 98418A | IMAGE/45 (ROMs only) |
|  | Note: You must specify appropriate language version |
|  | Opt. 330 English DBMs |
|  | Opt. 331 French DBMs |
|  | Opt. 332 German DBMs |
| 98430A | Data Base Management System (IMAGE/45, QUERY/45) |
|  | Note: You must specify appropriate language version |
|  | Opt. 330 English DBMs |
|  | Opt. 331 French DBMs |
|  | Opt. 332 German DBMs |
| 98438A | Assembly Language Execution ROM |
| 98439A | Assembly Execution and Development ROM |
|  | THERMAL LINE PRINTERS |
|  | Note: ASCII/EUR printer is shipped with all models unless otherwise stated. Order only one. |
| Opt. 040 | 8.5 inch paper width, Katakana character set. |
| Opt. 041 | 210 mm paper width, Katakana character set. |
| Opt. 061 | 210 mm paper width, ASCIIEUR character set. |
| 98460A | SECOND TAPE CARTRIDGE DRIVE (9845B and 9845C Opt. 100 or 200 only) |
| 98470A | GRAPHICS DISPLAY SUBSYSTEM (9845B Opt. 100 only) (order with 98411A) |
| Opt. 101 | Field Installation character for above options. |
| 98775A | LIGHT PEN (9845B Opt. 200) |
|  | 9845C Opt. 100 or 200 (NA for 9845B Opt. 175) |
|  | UPGRADE KITS |
| 98401A | 9845S to 9845B Opt. 150 includes 576K bytes of R/W memory, Graphics ROM, and Printer ROM. |
| Opt. 312 | I/O ROM |
| Opt 313 | Mass Storage ROM |
| Opt. 800 | ASCII Keyboard |
| Opt. 810 | French Keyboard |
| Opt. 820 | Spanish Keyboard |
| Opt. 830 | German Keyboard |
| Opt. 840 | Katakana Keyboard |
| Opt. 850 |  |
|  | Options 800 through 850 are the language options and include the language ROM's in the mainframe, the appropriate ROM for the printer, and the CRT. |
| 98402A | 9845A to 9845B Opt. 100 Upgrade Kit includes 56K bytes of R/W memory. |
| Opt. 311 | Graphics ROM for 98402A |
| Opt. 560 | ASCII/EUR printer ROM. The options listed under 98401A are also available for 98402A. |
| 98403A | Fast language Processor (for 9845B/C only). |
| 98404A | Monochromatic Display Upgrade kit. for the 9845B Enhanced Graphics. Requires 98403A. |
| Opt. 041 | Katakana Display. |
| Opt. 775 | Light Pen. |
| 98405A | Combines 98403A and 98404A. |
| Opt. 041 | Katakana Display. |
| Opt. 775 | Light Pen. |
| 98771A | 9845B to 9845C upgrade kit. |
| Opt. 101 | Katakana Character set. |
| Opt. 771 | ASCII/EUR Character set. |

| 98417A | BASIC Datacomm ROM. |
| 98418A | RJE Bisync Datacomm ROM (Requires 98417A) |
| 98419B | Resource Management ROM (also order 98029A with one option) |
| 98429A | IMAGE/45 Data base management. |
| 98430A | Data Base Management System (IMAGE/45 management ROM and Query/45 software) Requires 98413C and 98414A. I/O ROM not required, but if used with IMAGE must be Revision C. Order one of the following: |
| Opt. 330 | English Language. |
| Opt. 331 | French Language. |
| Opt. 332 | German Language. |
| 98438A | Assembly Language Executive ROM. |
| 98439A | Assembly Executive and Development ROM. |
|  | 9841,1, 412, 413, 414, and 415 are all supplied with all 9845B/C computers. |
|  | 9845B-175, 275, and 9845C-275 all include 98417. |
|  | 9845B/C-280 include 98430 (which includes 98429). |
|  | READ ONLY MEMORIES |
| Opt. 311 | Graphics ROM (for 9845B Opt. 100 only). |
| Opt. 312 | I/O ROM |
| Opt. 313 | Mass Storage ROM. |
| Opt. 314 | Advanced Programming ROM. |
| Opt. 438 | Assembly Language Execution ROM |
| Opt. 439 | Assembly Language Execution and Development ROM |
|  | THERMAL LINE PRINTERS (order only one) For 9845B and 9845C Opt. 100 or 200 |
| Opt. 560 | $81 / 2 \mathrm{in}$. paper, ASCII or European character sets |
| Opt. 561 | 210 mm paper, ASCII or European character sets |
| Opt. 540 | $81 / 2$ in. paper, Katakana character set |
| Opt. 541 | 210mm paper, Katakana character set For 9845B/C Opt. 150,250,270,190,290 |
| Opt. 060 | $81 / 2 \mathrm{in}$. paper, ASCII or European character sets |
| Opt. 061 | 210 mm paper, ASCII or European character sets |
| Opt. 040 | $8^{1 / 2} \mathrm{in}$. paper, Katakana character set |
| Opt. 041 | 210 mm paper, Katakana character set |
| Opt. 600 | SECOND TAPE CARTRIDGE DRIVE <br> Order for 9845B and 9845C Opt. 100 or 200 only. |
| Opt. 700 | GRAPHICS DISPLAY SUBSYSTEM 9845B Opt. 100 only, order with Opt. 311 |
| Opt. 775 | LIGHT PEN <br> Order or 9845B Opt. 200 or 9845 C Opt. 100 or 200 |

| Product No. | Description |
| :---: | :---: |
|  | KEYBOARDS |
|  | Note: Keyboards are available only as factory installed optionis. |
| Opt. 800 | ASCII |
| Opt. 810 | French |
| Opt. 820 | Spanish |
| Opt. 830 | German |
| Opt. 840 | Katakana |
| Opt. 850 | Swedish/Finnish |
| 98407A | 512 K bytes of incremental RAM (any $9845 \mathrm{~B} / \mathrm{C}$ ). Up to 1.6 M bytes total may be installed. (existing 128K RAM may need to be removed to make room) Are compatible. |
| Opt. 001 | Memory upgrade kit. Required for $9845 \mathrm{~B} / \mathrm{C}-100,160,190,200,250,270$, or 290 when the first 512 K board is installed. |
| Opt. 002 | Enhanced graphics ROM upgrade kit. Required for any 9845B/C that has Rev A, Enhanced graphics ROM or Color graphics ROM installed. |
| Opt. 003 | Image upgrade kit. Required if the $9845 \mathrm{~B} / \mathrm{C}$ has a rev B or earlier Image ROM in the left hand ROM drawer. |

## Accessories Available

Single items may be purchased using the appropriate part number.
Peripheral devices, ROMs and interface cards are packaged separately from the 9845; each of these has its own manual or operating note and may also have extra items packaged with it.

| Item | $9845 \mathrm{~B} / \mathrm{C}$ <br> All Options |
| :--- | :---: |

## 9845B/C Mainframe Serial Numbers

Serial numbers for the 9845B/C mainframes are keyed to three situations. An example and explanation is as follows:

Serial \#1832A00123 Located on the back panel next to the power connector.

## 9845B/C Options

|  | 9845B Opt. |  |  |  |  |  |  |  |  |  |

## 9845B/C Environmental/Installation/PM

## Chapter

2

## 9845B/C Environmental Specifications

## 9845B/C Electrical Specifications

The following specifications are common to both the System 45B and 45C.
POWER REQUIREMENTS

| Source (selected by rear panel switch) | $110 \mathrm{Vac}+15 \%,-20 \%$ $220 \mathrm{Vac}+15 \%,-20 \%$ |
| :---: | :---: |
| Line Frequency | 4866 Hz |
| Power Consumption. | 500 watts (max.) |
|  | 7.5A@90-126V |
|  | 3.5A@ 198-252V |

550 watts (max.) add'l for 9845C CRT display only
Powerline Susceptibility. $\qquad$ passes $\pm 400 \mathrm{Vac}$ pulse
(duration $=800$ nanoseconds, rise time $=1$
nanosecond) with 60 Hz pulse repetition
Environmental Range
Operating Temperature
$5^{\circ} \mathrm{C}$ to $40^{\circ} \mathrm{C}$
Storage Temperature
$-40^{\circ} \mathrm{C}$ to $+65^{\circ} \mathrm{C}$
Relative Humidity
$5 \%$ to $80 \% \approx 40^{\circ} \mathrm{C}$

## 9845B/C Physical Specifications

| SPECIFICATIONS | HP 9845 B (with standard processor and CRT) | HP 9845B (with enhanced processor and CRT) | HP 9845C |

## 9845B/C Installation

## Introduction

The following pages cover installation, maintenance, and system testing for the HP 9845B and HP 9845C Desktop Computers. Where similar, the computers are referred to as the "System 45 " or the " 9845 ". Any differences between computers or models are noted when necessary. The following table shows the configuration for the model numbers which are referred to.

|  | Monochromatic <br> CRT <br> $(98750 A)$ | Monochromatic CRT <br> With Enhanced Graphics <br> $(98780 A)$ | Color CRT <br> (98770A) |
| :--- | :---: | :---: | :---: |
| Standard Processor <br> Enhanced Processor | 9845B Model 100 | - | 9845C Model 100 |

There are other models which are based on the model numbers in the previous table. The 9845B Model 150, for instance, is a 9845B Model 100 with a thermal printer, two tape drives, graphics, and 187 K-bytes of read/write memory. For simplicity, this manual refers to Models 100 and 200 only. If you have a 9845B Model 150, just remember that your computer is referred to as the 9845 B Model 100 in this manual.

## Table Mounting

The System 45 mainframe can be attached to a table top by replacing each foot with an internally threaded device and bolting up through the table top. Bolting the main frame to a desk which has a lockable drawer secures the computer from theft. Care must be taken in laying out the bolt holes so that the front edge of the computer overhangs the edge of the table top. This ensures that the air filters can still be removed and cleaned.

The computer can be secured to the top of a table or desk in the following manner:

- Drill four holes in the top surface of a table to accommodate $5 / 16-24 \mathrm{NF}-2 \mathrm{~A}$ screws according to the following diagram.
- Replace the four rubber feet attached to the bottom of the computer with the four hexagonal spacers supplied with the Table Mounting Accessory (P/N 09845-61201), using the 6-19X. 438 Pan Head, Pozidrive, Plastite screws, also supplied.
- Attach the computer to the table top, using four 5/16-24 NF-2A machine screws that are $3 / 8$ inch longer than the thickness of the table top. The hexagonal spacers should be held with a wrench while these screws are tightened to prevent stripping the smaller screws out of the plastic base.
- The keyboard should extend 8.25 inches in front of the table top, as shown, to make the air filters accessible for periodic cleaning or replacement.

## Installing the CRT

The System 45 comes equipped with a CRT (Cathode Ray Tube) display. The eight keys directly below the CRT screen on the 9845B Model 200 and the 9845C are called softkeys. The "CRT puil-out cards" (under the CRT) serve as a handy reference for operating the computer.

## Installing the 9845B Model 100 CRT

Align the guides on the CRT assembly with the mainframe support legs, as shown here. Notice that the buttons on the bottom of the CRT assembly align with the notches in the support legs.

After careful alignment, allow the CRT to rest on the support legs.
To remove the CRT, press the CRT release buttons and pull up.
Installing the 9845B Model 200 CRT or the 9845C CRT

## WARNING

THE 9845C COLOR DISPLAY (CRT) WEIGHS 29.5 KILOGRAMS ( 65 LBS.). TO AVOID PERSONAL INJURY OR DAMAGE TO THE EQUIPMENT, IT IS RECOMMENDED THAT THE COLOR DISPLAY ALWAYS BE LIFTED BY TWO PEOPLE.

Inspect the interconnect PC assemblies in both legs of the display, making certain that they are straight. Also check the metal tab guides on the support legs of the mainframe. They should be straight or bent slightly toward the PC board connector.

The sliding lock handles ${ }^{1}$ - on each leg of the display - should be pulled out (in the open position).

Working on one leg at a time, tilt the display slightly to the right and guide the right leg into place. Pull the display to the left toward the other leg, and position the left leg into place.

The back of both display legs should now be resting on the top cover of the mainframe. (If not, check both sliding lock handles - they should be pulled out.) There should be a gap (about $1 / 4$ inch) between the mainframe top cover and the front of the display legs. If the display does not appear to be sitting properly on the mainframe, repeat the previous step.

[^0]With the display sitting level, push down firmly on the top front of the display. This compresses the RFI gasketing and ensures proper contact with the mainframe.

Now push the sliding lock handles in, to secure the CRT to the mainframe.
To remove the CRT, pull the sliding lock handles out and lift the CRT straight up. (Remember that two people are needed to lift the color display.)

## CRT Intensity

Once the System 45 has been set up and is operating, CRT brightness is controlled by a small dial underneath the CRT. It is located on the right-hand side of the 9845B Model 100 and on the left-hand side of the 9845B Model 200 and the 9845C.

## Note

Hewlett-Packard products which use Cathode Ray Tubes are designed to limit X-radiation levels to values of $0.5 \mathrm{mR} /$ hour ${ }^{1}$ or below at 5 cm distance. This level has been established by the United States Bureau of Radiological Health and conforms to similar international requirements. All measurements are made using equipment that is VDE certified, and are conducted with the equipment operating under normal conditions as well as worst case maladjustment.

[^1]
## Functional Areas of the CRT

## CAUTION

ALWAYS SWITCH OFF THE COMPUTER WHEN INSERTING OR REMOVING ROMS. FAILURE TO DO SO COULD DAMAGE THE EQUIPMENT.

## ROMs Update List

Plug-in Option ROMs available for use with the 9845 are shown in the following table.

| Option ROM Name | Option Option ROM Number | Amount of Read/ Write Memory Used |
| :---: | :---: | :---: |
| Graphics (9845B Model 100 only) | HP 98411B or Opt. 311 | 90 bytes |
| Enhanced Graphics (9845B Model 200 and 9845C) | (standard) | 264 bytes |
| I/O | HP 98412A or Opt. 312 | 640 bytes |
| Mass Storage | HP 98413B or Opt. 313 | None |
| Advanced Programming | HP 98414A or Opt. 314 | None |
| Structured Programming | HP 98415A | None |
| Basic Datacomm | HP 98417A | 380bytes |
| Bisync Datacomm | HP 98418A | 40 bytes |
| Assembly Execution | HP 98438A or Opt. 438 | See the Assembly Execution ROM Manual |
| Assembly Execution and Development | HP 98439A or Opt. 439 | See the Assembly Development ROM Manual |
| Data Base Management System | HP 98430A or Model 190, Opt. 330, 331, or 332 (Model 280 includes these ROMs also) | 120 bytes |

## The Option ROM Drawers

The 9845 has two ROM drawers which contain the ROMs. They are located on each side of the machine at the base of the dark stripe.

The ROMs that belong in the left-hand drawer have green labels, and those that belong in the right-hand drawer have black labels. Since it is important that each ROM be inserted in the proper drawer, the drawers are designed to prevent inserting a ROM in the wrong drawer.

The labels on the drawers and the ROMs have symbols on them: a circle, square, or triangle. Use these symbols as a guide for matching ROMs to the appropriate slots.

- O

ROMs can go in $O$ or $\square$ slots.
$-$ROMs must go in $\qquad$ slots.

- $\Delta$ ROMs must go in $\Delta$ slots.

## Installing and Removing ROMs

To insert a ROM:

- Slide the drawer all the way out and make sure the label color matches that of the ROM you want to insert.
- Open the clear plastic cover by squeezing the sides of the cover to gain access to the connectors.
- Orient the ROM so that the tops of the letters on the label are toward the computer.
- Make sure that the shape ( $O, \square$ or $\Delta$ ) on the ROM corresponds to the shape for the slot.
- Insert the ROM vertically so that it goes all the way to the bottom of the connector. The small raised rib on the top of the drawer should fit into the recess on the bottom of the ROM. If it doesn't, make sure you have made the proper color, shape and orientation matches.
- When the ROM is inserted, snap the clear cover shut and close the drawer until it is flush with the outside cover of the computer.

To remove a ROM:

- Turn the power switch off.
- Slide out and open the proper drawer.
- Gently pull the ROM straight up.
- Close the cover and slide the drawer in.

## Connecting Interfaces

## CAUTION

ALWAYS SWITCH OFF THE COMPUTER WHEN INSERTING OR REMOVING INTERFACES. FAILURE TO DO SO COULD DAMAGE THE EQUIPMENT.

Peripheral devices are connected to the 9845 computer with an interface. An interface can be inserted into any of the four I/O slots in the back of the computer, as shown.

## Interface Select Codes

A select code is set on each interface at the factory. To change the select code, use a small screwdriver to rotate the switch which is accessible through the top of the interface rear housing. Do not set two or more interfaces to the same select code number.

The following select codes are permanently reserved by the system and should not be set on any interface:

0 - Internal thermal printer and keyboard
13 - Graphics
14 - Left tape cartridge drive
15 - Right tape cartridge drive
16 - CRT

## Checking Fuses, Voltage and Power Cords

## Introduction

The 9845B has a power cord connector, a fuse, and a voltage selector switch located on the rear panel of the mainframe, as shown.

The 9845C mainframe and CRT each has its own power cord connector and fuse. The mainframe has one voltage selector switch and the CRT has two. These are located on the rear panels of the CRT and mainframe, as shown.

## Fuses

## WARNING

TO AVOID THE POSSIBILITY OF SERIOUS INJURY, DIS CONNECT THE AC POWER CORD(S) BEFORE REMOVING OR INSTALLING A FUSE.

A different fuse is required for each of the two voltage ranges of 120 Vac and 240 Vac . The proper types and ratings are shown in this table.

| Voltage <br> Rating | Fuse <br> Rating | Part <br> Number |
| :---: | :---: | :---: |
| $\mathbf{1 0 0 . 1 2 0}$ | 10 NB | $2110-0051$ |
| $\mathbf{2 2 0 , 2 4 0}$ | 6 NB | $2110-0056$ |

Always be sure that the correct fuse is installed. Failure to do so may result in damage to the computer. When changing a fuse, make sure that the replacement is the proper rating and type.

The previous drawings show the location of the fuse(s) on the System 45. (The 9845B has one fuse, the 9845 C has two fuses.) To change a fuse, first disconnect the power cord(s) from the computer.

## Voltage

WARNING
ALWAYS DISCONNECT THE COMPUTER FROM ÂÑY AC POWER SOURCE BEFORE SETTING A VOLTAGE SELECTOR SWITCH.

The 9845B voltage selector switch is located on the rear panel of the mainframe. The 9845C switches are located on the rear panels of the computer and CRT. To alter the setting of a switch, slide the switch so that the position of the slot corresponds to the correct voltage, as previously shown.

## CAUTION

CHECK THE SELECTOR SWITCH SETTING BEFORE APPLYING POWER. DAMAGE TO THE COMPUTER WILL OCCUR IF A SELECTOR SWITCH IS SET TO 110 VOLTS AC AND 220 VOLTS AC IS APPLIED TO THE POWER INPUT CONNECTOR.

Next, ensure that the voltage selector switch (three switches on the 9845C) is set for the nominal line voltage, as shown here.

## Power Cords

## WARNING

IF IT IS NECESSARY TO REPLACE A POWER CORD, THE REPLACEMENT CORD MUST HAVE THE SAME POLARITY AS THE ORIGINAL. OTHERWISE A SAFETY HAZARD FROM ELECTRICAL SHOCK TO PERSONNEL, WHICH COULD RESULT IN INJURY OR DEATH, MIGHT EXIST. IN ADDITION, THE EQUIPMENT COULD BE SEVERELY DAMAGED IF EVEN A RELATIVELY MINOR INTERNAL FAILURE OCCURRED.

The 9845B has one power cord, and the 9845C has two (one for the mainframe, one for the CRT). Power cords with different plugs are available for the 9845 . The cords(s) packaged with each computer depends upon where that computer is to be delivered.

Power cords supplied by HP have polarities matched to the power-input socket on the computer:

- $\mathrm{L}=$ Line or Active Conductor (also called "live" or "hot")
- $\mathrm{N}=$ Neutral or Identified Conductor
- $E=$ Earth or Safety Ground

Power cords with different plugs are available for the equipment; the part number of each cord is shown below. Each plug has a ground connector. The cord packaged with the equipment depends upon where the equipment is to be delivered.
Option Number

## Grounding Requirements

To protect operating personnel, the National Electrical Manufacturer's Association(NEMA) recommends that all equipment be properly grounded. HP 9845 systems are equipped with three-conductor power cables which, when connected to an appropriate power receptacle, ground the computer. To preserve this protection feature, do not operate the computer from an $A C$ power outlet which has no ground connection.

[^2]
## FCC Radio Frequency Interference Statement

## FEDERAL COMMUNICATIONS COMMISSION <br> Kãdió frequency interference STATEMENT (U.S.A. ONLY)

The Federal Communications Commission (in Subpart J of Part 15. Docket 20780) has specified that the following notice be brought to the attention of the users of this product.
Warning: This equipment generates. uses. and can radiate radio frequency energy and if not installed and used in accordance with the instructions manual. may cause interference to radio communications. As temporarily permitted by regulation it has not been tested for compliance with the limits for a Class A computing device pursuant to Subpart $J$ of Part 15 of FCC Rules, which are designed to provide reasonable protection against such interference. Operation of this equipment in a residential area is likely to cause interference in which case the user at his own expense will be required to take whatever measures may be required to correct the interference.

## Initiating Power

Once the computer is set up properly, it is ready to turn on. Before you do, here are some things to check:

- Is the proper type of fuse installed?
- Is the proper voltage set?
- Are the ROMs installed?
- Are the interfaces and peripherals connected?

Next connect the power cord (two on the 9845C) to the power input connector on the rear panel of the mainframe (and CRT - 9845C). Plug the other end of the cord into an AC power outlet.

CAUTION
SHOULD A SINGLE, BRIGHT, HORIZONTAL LINE APPEAR ACROSS THE CENTER OF THE CRT, IMMEDIATELY SWITCH THE COMPUTER OFF TO AVOID DAMAGE.

Now that the system is set up, set the power switch on the right side of the machine to the " 1 " position to turn it on.

Set the CRT intensity using the knob under the front of the CRT.

## Loading Printer Paper

The internal printer is an 80 -character line printer used for hardcopy output. Refer to the section entitled "Accessories Supplied" for part numbers of the types of paper.

## CAUTION

HP SUPPLIED THERMAL PAPER IS FORMULATED SPECIFICALLY TO WORK WITH THE SYSTEM 45 INTERNAL PRINTER. THERMAL PAPER FROM OTHER SOURCES MAY OR MAY NOT WORK WITH THE INTERNAL PRINTER AND, THEREFORE, HP IS NOT RESPONSIBLE FOR DAMAGES CAUSED BY USING NON-HP PAPER.

The average life of the internal thermal printhead is about 50,000 feet of paper, or about 250 rolls.

> Note
> If you want to use Metric paper in the thermal printer, the Metric Paper Spacer (P/N 5040-8145) must be installed in the paper holder, on the right-hand side.

Two keys are used to control the printer paper. The PAPER ADVANCE key advances the paper until the key is released. The TOP OF FORM key advances the paper past perforations to the top margin (approximately 1.25 cm , or $1 / 2$ inch, below the perforations). If the paper is not perforated, it is advanced 30.5 cm ( 12 inches).

Printer paper is loaded using the following procedure.

- Make sure the computer is switched ON.
- Lift or remove the access cover on the top of the printer by pushing down on the raised surface at the rear of the door. The door can be removed by lifting up and pulling it toward you.
- Remove and discard the paper core of any previous roll. If the remaining roll of paper is small and a new roll is to be installed, remove the old roll. To do this, first unroll and lift the old roll upward. Then tear the paper off using the paper guide.
- If any paper remains in the printer mechanism, remove it by pressing the PAPER ADVANCE key until the paper is completely out.
- Remove the first layer of paper from the new roll. Be sure the paper has a cleanly torn or cut edge. Fold the corners in to form a point.
- Insert the new roll such that the free end is positioned as shown. Press the PAPER ADVANCE key until the paper appears at the front of the printer. Then reinstall the access door by placing it on the hinge pins and pushing until it snaps into place.

## Inserting and Removing the Tape Cartridge

Insert the tape cartridge so that its label is up and the open edge is toward the computer, as shown below. Both the drive window and the door beneath it open when a cartridge presses on the iower door. The cartridge can then be inserted.

To remove the tape cartridge, press the eject bar. If it is pulled out without pressing the eject bar, another catridge cannot be inserted until the eject bar is pressed. Do not remove the tape or execute reset while it is moving; damage to the tape may result.

## 9845B/C Mainframe Verification

## 9845B/C System Exerciser

The programs on the System Exerciser Cartridges (HP P/N 09845-92041 Revision C and 09845-92042 Revision A) are designed to assure you that the System 45 is operating properly, and if it is not, to identify problem areas which may exist. Some exercisers require that you compare what is displayed or printed to what is described in this manual. All of the exercisers display error messages when errors are detected.

If any exerciser should fail, please note the error and refer to Section 4, Troubleshooting.
The exercisers are divided into three types: internal mainframe, peripheral, and interface. The internal mainframe exercisers should be run first to exercise the System 45 mainframe thoroughly before running any of the external peripheral or interface exercisers. Refer to the appropriate chapter of this handbook for interface and peripheral exercisers.

## 9845B/C Turn-On Self Test

When the 9845 is turned on, a self test occurs. The processors go through a test routine, if successful, the 9845 will beep at least once. The numbers of beeps isn't important. The processors also check to see the type of CRT they'll send display data to, and determine which processor is PPU/LPU. A CRT must be attached for this processor ID routine to finish, if none is connected, the processors hang up, the 9845 appears dead.

Next, RWM is tested to ensure at least 16 K bytes exists in block 0 , and tests graphics RWM if graphics is installed. The graphics raster may be seen flashing different patterns during the graphics RWM test, followed by "MEMORY TEST IN PROGRESS" on the display. Normally, the CRT circuits may not be warmed up enough for the graphics RWM tests to be seen. Should errors be trapped during the RWM tests, the CRT should display "PART OF MEMORY FAILED SELF-TEST". The amount of RWM that's lost can be determined by executing LIST and comparing available RWM with the amount of RWM the 9845 should have.

When the turn-on tests are successfully completed, the display should read: "9845 READY FOR USE', If AUTOST had been latched, and a tape inserted in T15, the tape should rewind and load the AUTOST program and run it.

Refer to the 9845B/C Mainframe Troubleshooting, Section 4, if this test has errors or fails.

## Exerciser Starting Procedure

Before starting, use the following checklist to ensure that the 9845B/C is ready for testing.

- Switch power off.
- On the back panel, check to ensure that the line voltage selector switches are set, and that the correct fuse(s) is (are) installed.
- Verify that the ROMs and interfaces are properly installed.

Latch the AUTOST key on the computer. Begin by inserting System Exerciser Cartridge \#1 in the right-hand tape drive so that the cartridge label faces up and out. Switch on power to the System 45, and the computer should load and run the supervisory exerciser program. If this does not happen, or if a blinking cursor does not appear on the CRT within about 20 seconds after turn-on and cannot be obtained by pressing CONTROL STOP, refer to Section 4, Troubleshooting.

The supervisory exerciser program can also be loaded by typing LOAD "AUTOST:T15" and pressing EXECUTE.

When the supervisory exerciser program begins to run, the following information is displayed:

## 9B45B/C SYSTEM EXERCISER Do you want PRINTED outfut (Y,N)?

Answer $Y$ for yes or $N$ for no. and press CONT. If you want the printout to appear on the CRT, answer no. If you answer yes, you are asked to:

Please enter the PRINTER select code...
For non-HP-IB printers, enter the interface select code. (Enter 0 for the internal printer.)
If you have an HP-IB printer, answer with the select code and the device address entered together as a three or four digit number. The interface select code can be a one or two digit number which represents a valid select code. The device address must be a two digit number. For example, a 9871A Printer (HP-IB option only) connected on interface 7 with its address set to 6 is entered as " 706 ". (Secondary addressing of HP-IB devices is not allowed.)

The choices of exercisers for System Exerciser Cartridge \#1 are then printed on the specified printer (or the CRT).

An asterisk (*) appearing before any of the MAINFRAME exercisers shows that that particular option is not installed.

Use the same procedure to run the exercisers on System Exerciser Cartridge \#2.
Now select and run exerciser(s) as explained on the following pages.

## 9845B/C Mainframe Exercisers

## Selecting an Exerciser

There are three exercisers that you should run to exercise your System 45 Mainframe.

- The memory (MEMORY) exerciser performs a checksum on the System 45 ROMs and also checks the read/write memory.
- The tape (TAPE) exerciser checks the tape drive(s) on the System 45. It first exercises the right-hand tape drive, and then the left-hand tape drive (if it is present).
- The printer (PRNTR) exerciser checks the operation of the thermal printer (if it is installed).

The ROM revision (ROMREV) exerciser (located on System Exerciser Cartridge \#2) determines the components (processor, CRT, and ROMs) that comprise your System 45. You do not need to run it unless you want to know exactly what the internal system includes.

If you have decided that you want to run only one of the mainframe exercisers, type its name and press CONT.

It is possible to enter up to eight exercisers, to be run one after another, as long as they are all located on the exerciser cartridge. The exercisers are fun starting with the first one in the list. Each exerciser name is separated from the next with the divide (/) symbol, as shown here:

PRNTR/TAPE/DISPLA,ADJ/9872A.701/98035A,5
or ROMREV/G111A,70E
Entering COMP as the exerciser results in four (DISPLA, TAPE, PRNTR, and GRPHC, CLRGR, or ENHGR) of the exercisers being run.

Once you have entered the exerciser name(s) and pressed CONT, you are asked to enter the number of times you want each exerciser to be run. The maximum number of repetitions is 25. However, the MEMORY exerciser cannot be run more than once at a time. Before you enter the number of times the exerciser(s) should be run and press CONT, refer to the appropriate parts of this chapter for more detailed information about each exerciser.

Each exerciser should run as described in this chapter. If any exerciser does not run properly, note the error and refer to the Diagnostics, Section 5.

After any exerciser has completed its operation, the following message is displayed:
_ message(s), \# runs = _ Press CONT
This tells you the total number of errors which occurred during the total number of exerciser repetitions.

## Note

Except for MEMORY and the graphics memory tests, you can stop an exerciser at any time for careful examination of the display by pressing PAUSE. A program line will also appear on the screen. Press CONT to complete the exerciser.

## Memory Exerciser (MEMORY)

Due to the comprehensive nature of the MEMORY exerciser, the following special circumstances exist:

- There is no printed output available. Test results are displayed on the CRT.
- Multiple repetitions of the MEMORY exerciser are not allowed.
- When you wish to run the MEMORY exerciser, it must be the only exerciser selected.

Pressing any keys on the keyboard while the MEMORY exerciser is running may cause an error.
Error messages are displayed if errors occur. If you want to stop the exerciser while it is running, press the STOP key.

The exerciser begins by displaying a blinking:
ROM CHECKSUM TEST RUNNING
A ROM checksum failure is indicated by the message:
ROM CHECKSUM FAILURE BLK X ADDRESS XXXXXX-XXXXXX
Refer to Section 4, Troubleshooting to interpret messages. If this message is displayed, press CONT to continue the exerciser. The memory check is run next while the CRT displays a blinking:

## r/W MEMORY EXERCISER RUNNING

During the memory check, the CRT displays various characters and lines on its print area. This is normal.

A read/write memory failure is indicated by the message:
Memory error blk X address XXXXXX has XXXXXX not XXXXXX

## Note

The display may have a variety of patterns on it for a short period of time during the MEMORY exerciser. This is normal.

A message is displayed when the exerciser has completed.

## Tape Exerciser (TAPE)

In order to run this exerciser, the system exerciser cartridge in the right-hand tape drive must be unprotected (tab slid to the right). If you want to exercise the left tape drive, an unprotected tape cartridge (which has been initialized) must be installed in it.

> Note
> If files named DATA1. DATA2. DATA3. DATA4. or DATA5 exist on the tape which you insert in the left tape drive, they will be purged by this exerciser.

It is suggested that you set the print all mode by pressing and latching the PRT ALL key. This enables you to see every message which is displayed. When the exerciser has completed, press and unlatch the PRT ALL key to turn off the print all mode.

The tape exerciser begins by prompting you with these messages:

```
CREATING FILE DATAI
CREATING FILE DATA2
CREATING FILE DATA3
CREATING FILE DATA4
CREATING FILE DATAS
ASSIGNING 8.FILLING FILE DATA1
ASSIGNING 8: FILLING FILE DATA2
ASSIGNING 8: FILLING FILE DATA3
ASSIGNING 8: FILLING FILE DATA4
ASSIGNING &: FILLING FILE DATAS
```

followed by various read and write messages.
When the right-hand tape drive (T15) test is finished, this message is displayed:

```
TAPE UERIFY DONE :T15
```

Then the exerciser checks for the presence of the left tape drive (T14). If it is present, the exerciser is re-executed for T 14 . If it is not present, the exerciser continues normal operation. If your System 45 has a left tape drive, but a tape cartridge is not installed in it, the following message is displayed (or printed):

```
TAPE CARTRIDGE OUT :T14-EXERCISER NOT RUN
```

## Printer Exerciser (PRNTR)

The exerciser begins with a formfeed and this printout (which you should compare to your own):

```
EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE
EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEGEEEEEEEEEGEEEEEEEEEEEEEE
```

``` EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE
```

## ROM Revision Exerciser (ROMREV)

The ROM revision exerciser gives you a report similar to this one:

To check for problems, first find your particular machine configuration at the top of the report (9845B (Fast LPU) Fast Black \& White, for instance). Then check that column to see if it is filled with asterisks (*'s). If one or more are missing, or if there are any messages under "PROBLEMS??", refer to the troubleshooting section.

## Note

If your report shows the message "Unknown ROM!", you may or may not have a problem. It is possible that one of the ROMs in your machine is so new that this exerciser does not recognize it.

## 9845B/C Operating Basics

Here is a step-by-step guide to the basic operation of the System 45 (if you have already set up and tested the computer as described in the preceding pages). Simple arithmetic operations, and storing, loading, running, and listing a program are covered in this section.

## CAUTION

OPERATING THE COMPUTER BEFORE IT IS PROPERLY SET UP COULD DAMAGE IT, SO IF THE COMPUTER IS NOT ALREADY INSTALLED AND READY TO USE, READ THE PROCEDURES IN THE PRECEDING PAGES FIRST.

## System 45

## Basic Keyboard Operations

If you make a typing error in a line, use the $\square \square$ and $\square$ display keys to move the cursor until it is under the character you wish to change. Then type the correct character in its place. Use the $\square$ and $\square$ display keys to move to another line that you wish to change.

## Executing Computations

To do simple arithmetic, use the numeric section of the keyboard. First, try converting some Fahrenheit temperatures to Ceisius temperatures. The formula to use is $(\mathrm{F}-32) *(5 / 9)$. Type the following to convert $54^{\circ} \mathrm{F}$ :

$$
(54-32) *(5 / 9) \text { EXECUTE }
$$

In general, spaces are not important, so you get the same answer if you type:

```
(54-32)*(5/9) EXECUTE
```

By pressing the RESULT key, the answer to the previous calculation can be used as part of another calculation. Use it to convert the $12.22^{\circ} \mathrm{C}$ answer back to its Fahrenheit value. Type this calculation, pressing the RESULT key for the RES function:
(RES*9/5) +32 EXECUTE

## Simultaneous Computations

Two or more computations can be entered and solved at the same time by separating each with either a semicolon (for close spacing of the results) or a comma (for 20 -character fields). These calculations which convert $212^{\circ} \mathrm{F}$ toCelsius degrees and $100^{\circ} \mathrm{C}$ to Fahrenheit degrees:

```
(212-32)*(5/9),(100*9/5)+32 EXECUTE
```

## Using Variables at the Keyboard

Variables can be assigned values using an equals sign to create an assignment statement. For example, to assign 45 to F-lowtemp and 80 toF_hightemp, enter:
$\begin{array}{ll}\text { F_lowtemp }=45 & \text { EXECUTE } \\ \text { F_hishtemp }=80 & \text { EXECUTE }\end{array}$
Now that some variables have assigned values, they can be used in place of numbers in math calculations. Type the following:

F_averasetemp $=\left(F_{\_}\right.$hightemp+F_lowtemp) $/ 2$ EXECUTE
Assignment statements and calculations such as these can be put together in a logical sequence to form a program. Here is an example. Press the STORE key after typing each line.

```
10 PRINTER IS IG
20 Ftemp=155
30 Ctemp=(Ftemp-32)*(5/9)
40 PRINT Ftemp;Ctemp
50 END
```

Run the program by pressing RUN

## Mass Storage

Now you should store this program on a tape cartridge so that you can run it again at a later date.

To record on a tape cartridge, the record tab must be in the rightmost position, in the direction of the arrow (as shown):

The left tape drive is referred to as :T14 and the right-hand one is :T15. Insert a tape cartridge into the right-hand tape drive, type CAT": T15" and press EXECUTE. You should see a listing of the files that are stored on that tape cartridge.

If the display shows error 85 , then the tape has not been used yet. Before you can use a tape cartridge for storing programs or data, it must be initialized. Type INITIALIZE": T15" and press EXECUTE. The initialization procedure takes approximately three minutes to complete.

After the tape has been initialized and is unprotected (tab slid to the right), you can store the program (above) on it. Type the following:

STORE "TEMP:T15" EXECUTE
Now you can edit "TEMP" so that the message is printed on the computer's thermal printer instead of on the CRT. (If your machine does not have the printer option, you should not edit your program.) First, press the EDIT special function key, type the number 10, and press EXECUTE.

Using the $\leftarrow$ display key, move the cursor over until it is under the " 1 " in 16 . Change that 16 to a zero by pressing the " 0 " key and the space bar. Store this new line by pressing the STORE key.

Your program should now look like this:

```
10 PRINTER IS 0
20 Ftemp=155
30 Ctemp=(Ftemp-32)*(5/9)
40 PRINT Ftemp;"DEGREES FAHRENHEIT = ";Ctemp;"DEGREES CELSIUS."
50 END
```

You can change the temperature to be converted by changing the value in line 20 and pressing STORE.

Your "new" program can also be stored on the tape cartridge. Press the STOP key and then type the following:

STORE "TEMP2:T15" EXECUTE

Run the "TEMP2" program by pressing RUN. A message similar to this one should be printed on the thermal printer:

```
155 DEGREES FAHRENHEIT = 68.3333333334 DEGREES CELSIUS.
```

If you would like to see the first program "TEMP" again, you can load it back into the machine's memory from the tape cartridge by typing:

```
LDAD "TEMP:T15" EXECUTE
```

The program can be listed:

- on the CRT by typing LIST\#16 and pressing EXECUTE
- on the thermal printer by typing LIST* 0 and pressing EXECUTE

To see what is stored on your tape cartridge. The names TEMP and TEMP2 should be shown.

## Automatic Start for Programs

You can take advantage of the computer's automatic start capability by naming a program "AUTOST".

If a tape cartridge with a file named "AUTOST" is present in the right-hand tape drive and the AUTOST key is latched when you turn the machine on, the computer automatically loads and runs the "AUTOST"' program.

## 9845B/C Mainframe Preventive Maintenance

There is no scheduled preventive maintenance for the $9845 \mathrm{~B} / \mathrm{C}$ computer.
However, care of the air filters and tape read/write heads is explained in the Installation, Operation, and Test Manual.

2-26 9845B/C Environmental, Installation, and Preventive Maintenance Requirements

## Chapter

## 9845B/C Mainframe Configuration

Configurations of the $9845 \mathrm{~B} / \mathrm{C}$ mainframe and CRT are shown in the following table. Additional and more specific information regarding internal hardware requirements to support peripherals is listed in Section 7, Supported Peripherals.

## System Configurations

| Product No. | Description |

## 9845B/C Mainframe Troubleshooting

Chapter
4

## Troubleshooting Checklist

Here's a list of checkpoints when your 9845 doesn't seem to work at all or correctly. Several items are identified and their respective reference page in the 9845B/C Mainframe Handbook is shown.

| Checkpoint | Page |
| :---: | :---: |
| Power source |  |
| Correct Voltage | 2-1 |
| Correct Frequency | 2-1 |
| Ample Power Available | 2-1 |
| Proper Receptacle Contact | 2-12 |
| Proper Grounding | 2-12 |
| Noise/Interference Free | 2-13 |
| Power Cord; |  |
| Correct Connector Polarity | 2-12 |
| Wiring Continuity | 2-11 |
| Plugged In, Receptacle and 9845 | 2-10 |
| Mainframe Configuration; |  |
| Power Selector Switches, | 2-11 |
| Correct for Line Voltage | 2-11 |
| AC Line Switch at " 1 " Position | 2-13 |
| Fuse, |  |
| Correct Size, Rating and Type | 2-10 |
| Power Supply, |  |
| Proper Assembly for Option 1XX or 2XX | 9.7 |
| Output Voltage Within Specifications | 9-7 |
| Correct LED Indications on Opt. 2XX A81 | 9-7 |
| Processors, |  |
| Correct revision for application. | 9-8 |
| Memory, |  |
| Correct Revisions of ROM Chips for Application | 7-2 |
| Proper Type for CRT used | 9-2 |
| Correct Type for Keyboard Language | 7-3 |
| Proper Type for Processor |  |
|  |  |
| Proper Type for Application | 7-2 |
| Correct Revision for Application |  |
| Installed in Correct Location | 2-7 |
| Drawers Properly Seated/Installed | 2-7 |
| Standard RWM- |  |
| Correct Assemblies for Opt. 1XX or 2XX | 9-9 |
| Option RWM- |  |
| Block Jumpers In Correct Position | 9-9 |
| Sufficient Optional RWM for Application | 3-3 |
| Keyboard- |  |
| Correct ROM Chip In A27 for Language | 7-3 |
| Ribbon Cables Connected |  |

## Troubleshooting Tables

This table shows the assemblies that most likely have failed causing certain exercisers, tests, or diagnostics to fail. Across the top are the four main configurations of 9845 desktop computers. The left column is a listing of system exerciser and diagnostic tests. Under each mainframe type is a list of assemblies that could cause the failure, the most probable listed first followed by other assemblies that could also cause the problem.

For RWM and ROM failures, memory troubleshooting permits failure pointers to the chip level. See the memory map on page 9-4.

## Troubleshooting Flowchart

This flowchart is intended to guide you through various procedures to identify hardware failures in the 9845B/C Mainframe. QUICK CHECKs are used in virtually all cases. System exerciser and/or diagnostics are referred to when needed. Pointers are given to the 9845B/C CRT Chapter of this handbook when troubleshooting decisions indicate the failure is in the CRT.

In some cases, it may be necessary to substitute assemblies and parts not carried in the FSI kits. When total substitution is required, insure the following items are substituted:

| Motherboards | Wire harnesses |
| :--- | :--- |
| Ribbon cables | Ground wires |
| Option ROM Drawers | Software Packages |

Terms used in the flow chart and their meanings are:

| Configuration | The combination of parts, assemblies, mocules, <br> witch settings, power, interface cards, peripherals, <br> and software. Includes appropriate revisions and <br> model numbers where applicable. |
| :--- | :--- |
| Exchange: $\quad$Remove the defined assembly/part out of the <br> mainframe and install an exchange part of the <br> same number and revision. New assemblies/parts <br> may be used. |  |
| Install: $\quad$Place into the mainframe a part/assembly that was <br> not previously installed. |  |
| Remove: $\quad$Take the defined part/assembly out of the pro- <br> duct. |  |
| Reinstall: $\quad$Place back into the product the defined part/ <br> assembly that was previously removed. |  |
| Replace: $\quad$Remove the defined assembly/part and discard it. <br> Install a new part of the same number and revi- <br> sion. |  |
| Repair: $\quad$Use tools and/or component parts to correct fail- <br> ure on the defined assembly. |  |
| Substitute: $\quad$Remove the identified part/assembly from the <br> product. Install an identical part/assembly. This is <br> a temporary situation used to verify hardware fail- <br> ures. |  |

## Memory Troubleshooting

These memory maps and hardware locators show how to interpret memory error messages obtained from system exerciser and diagnostic memory tests.

Error message decoding:
RWM error example;
MEMORY ERROR BLK BB ADDRESS AAAAA HAS XXXXXX NOT YYYYYY
$\mathrm{BB}=$ The octal block number, hardware correllation is;
$0=$ A28 $\quad 1=$ A27
$2,4,6,10,12,14,16$ are on A26. 2 is not used.
AAAAA $=$ Is the octal address in the range 000040-077777, If most significant digit is $0-3$, address is low.
If most significant digit is 4-7, address is high.
XXXXX = Data read from address.
YYYYY = Data written into address.
To determine bit that failed, convert octal data to binary.
Example, XXXXXX $=000400=000000000100000000$
YYYYYY $=000000=000000000000000000$
Failed bit
Count binary bits from the right starting with zero, the failed bit is 8 . Refer to the hardware diagrams for bit/chip location on the memory board.

ROM error example:
ROM CHECKSUM FAILURE BLK BB ADDRESS SSSSSS - EEEEEE
$\mathrm{BB}=$ Octal block number, the hardware correlation is;

$$
\begin{array}{ll}
3=\mathrm{A} 28(46) & 5=\mathrm{A} 27 \\
7,13,=\mathrm{A} 44 & 11,15=\mathrm{A} 42
\end{array}
$$

SSSSSS = Starting address of the ROM that failed.
EEEEEE = Ending address of the failed ROM.

## Memory Troubleshooting

Memory errors in the read/write memory tests or the ROM checksum test can be translated to give the physical location of the memory error. Generally multiple failures indicate that the memory control logic is defective.

## Read/Write Memory Errors

Read/Write memory errors are displayed slightly different for the two RAM boards used in the HP 9845B/C computer. The display will be in one of the following forms:
a. For the 128 k byte RAM board (HP p/n 09845-66526):

$$
\text { MEMORY ERROR BLOCK OA ADDRESS } 002052 \text { HAS OOO NOT NOT O O }
$$

b. For the $512 k$ byte RAM board (HP p/n 09845-66590):
MEMORY ERROR BLOCK 24 ADDRESS 002052 HAS 000400 NDT 000000

1. First determine which memory assembly contains the block indicated in the error display. Refer to the following Figure for help:

128K byte Boards

Block Select Configuration Switches

| Blocks | LSB | $\overline{\text { LSB }}$ | MSB | $\overline{\text { MSB }}$ |
| :---: | :---: | :---: | :---: | :---: |
| $200-36$ | 1 | 0 | 0 | 1 |
| $40-56$ | 0 | 1 | 1 | 0 |
| $60-76$ | 1 | 0 | 1 | 0 |

512K byte Boards
Block Select Settings

```
MEMORY ERROR BLOCK O4 ADDRESS 002052 HAS 000400 NOT 000000
```

2. This digit of the octal word address indicates either the upper half (high address) or the lower half (low address) of a block. Note that this information is not needed for the 512 K board. The Block information is enough to locate the row of IC chips.
a. If this digit is 0 through 3 , the low address is indicated.
b. If this digit is 4 through 7 , the high address is indicated.
3. Decode the data into binary values and compare the bits:
a. Actual Data 0000000100000000
b. Expected Data 0000000000000000
4. The bits that do not compare indicate a defective RAM location. The following illustrations show the RAM chips that correspond to each bit position.

128K byte RAM Boards

## 9845B/C Mainframe Diagnostics

## Chapter 5

## 9845B/C Mainframe Diagnostics

## Introduction

This chapter will help you diagnose the 9845B/C Mainframe. The method used relies on the 9845B/C Test ROM and Binary Test Cartridge to isolate a faulty computer section. Both ROM and cartridge must be of the same revision letter.

This chapter is divided into the major mainframe sections. Each section consists of the description of the tests for that section. Use Table to find the tests and sections in this chapter.

9845B/C Mainframe Diagnostics are:

- Processor/Memory Addressing
- Memory (ROM and Read/Write)
- Keyboard
- Cartridge Drive
- Printer

Before you get to the various sections, use the trouble isolation procedures described in the quick check service procedure.

## Quick Checks

From the keyboard you can perform three checks to determine the basic condition of the computer. Press the CONTROL and STOP keys, then run one one or more of these three quick checks.

Keyboard Press random alpha keys on the keyboard (three or four X's should do it) and press execute. This generates an "improper expression" or an "improper character" error and an audible beep. If a beep occurs, the processor and operating system are probably working correctly. The CRT section may be defective.

Tape $\quad$ Here is a more demanding processor-memory test. See if a program can be entered into memory from tape. Install a tape and "GET" a data file from it, or "LOAD" a program file.

Printer If the printer is installed, execute the following lines:
PRINTER IS 0 press EXECUTE
PRINT "characters" press EXECUTE
If the characters are printed, the printer is basically working and the processor/ memory addressing is basically operating.

## Note

The keyboard bezel assembly may cause the computer to appear inoperative. To eliminate this possibility exchange the complete keyboard bezel assembly including tape logic, keyboard logic and keyswitch assembly.

If the quick checks have failed, an assembly may be causing the problem by "hanging up" the computer's memory bus (IDA lines). To eliminate this problem, remove all the assemblies non-essential to basic processor operation.

Remove the CRT assembly and the mainframe top cover; then remove the following assemblies:

- I/O Backplane Assembly A2
- Option ROM Drawers, A42, A44
- Printer Control Logic Assembly A51 (if printer installed)

Reinstall the CRT assembly and perform quick checks 1 and 2 again. The printing test won't work since the printer assembly is removed.

If the quick checks now work, then one of the assemblies you removed is probably defective. Isolate the problem by returning the removed assemblies to the mainframe one at a time.

If some of the quick checks work, the computer is basically functioning and you may need further information about symptoms from the customer in order to determine the section that should be tested.

If the printer or tape cartridge quick checks do not work, the problem may be associated with that particular section.

If none of the quick checks have worked the problem can be in the following sections:

- Power supply - check voltage and exchange if necessary.
- Processor/memory control - A15 (LMC), A16 (PMC), A30 (LMC).
- Memory - A28 (LRR), A27 (PRR), A26 (R/W), A46 (200 LRR).
- CRT assembly or A3/A34, see 9845B CRT Section of CE Handbook.

To further isolate one of the sections listed above, use this procedure.

- Check the power supplies for proper voltage output.
- Install the test ROM (09845-65520) and test cartridge (09845-91031) (see 9845B Diagnostic Programs).

## Note

The A3 or A34 assembly and the CRT assembly must be installed toperform the test ROM routines.

- Refer to the processor/memory control and memory sections and run the memory tests (the processor test is run automatically, but can be run by itself).

## Note

The Test ROM or test cartridge can fail; when in doubt about test results, try the system exerciser tape.

## 9845B Diagnostic Programs

The 9845B/C Diagnostics are contained in a plug-in ROM and a data cartridge. The test programs will help you to:

- Confirm a failure using exerciser programs
- Identify the failure using error printouts and displays
- Verify the solution using the exerciser program

Refer to Table XX for a summary of the tests contained in the ROM and cartridge.
The diagnostics are designed to test functional areas rather than assemblies. Functional areas often involve more than one PC assembly.

## Installation

In all cases:

- The test ROM is installed in the PPU ROM drawer (left drawer, A42).
- The binary test cartridge is installed in the right-hand drive (T15).

| Usage Combinations |  |  |  |
| :---: | :---: | :---: | :---: |
|  | ROM and Cartridge | ROM | Cartridge |
| Tests Available | ALL | Processor/Memory Addressing <br> Read/Write Memory Test <br> T14 and T15 cartridge drive test | All other <br> mainframe tests |
| Modes | Automatic RunMode | Automatic Run Mode | Automatic Run <br> Mode <br> Mperator Mode |
| 9845B Operating | Operating system can be: <br> System Requirements <br> - Faulty <br> - Operational | Operating system can be: <br> - Faulty <br> - Operational | Operating <br> system must |
| Installation | ROM installed in <br> PPU ROM Drawer A42 <br> Cartridge <br> installed in T15 | RCM installed in <br> PPU ROM Drawer A42 | Cartridge <br> installed in T15 |

## ROM and Cartridge Tests

| The Test ROM Contains | Initiated By |
| :--- | :---: |
| Processor/memory addressing test | Automatic |
| Read/write memory test | k 9 |
| Cartridge drive tests (T14 and T15) | k 2 |
| LPU Processor Test | k 13 |
|  |  |
| The Test Binary Cartridge Contains | Initiated by |
| CRT Alpha test ${ }^{1}$ | k 0 |
| Keyboard test | k 1 |
| Printer test | k 3 |
| I/O test | k 4 |
| CRT graphic test ${ }^{1}$ | k 5 |
| Rewind T15 | k 7 |
| Result printout | k 6 |
| Memorytroubleshooter | k 8 |
| Choose rack test sequence | k 10 |
| Automatic rack test | k 11 |
| Return to System/Program test | k 15 |

[^3]
## Using Both the Test ROM and Test Binary Cartridge

With both the test ROM and cartridge installed, tests are initiated by initial turn-on or pressing the CONTROL STOP keys.

## Note

If the ROM tests are being performed, the binary tape must be loaded to do the binary tape tests. Once in the binary tests, press the CONTROL STOP keys to return to the ROM tests.

Two modes are possible depending on the position of the autostart key.

| Mode | Mode Determined By | Tests Are |
| :---: | :---: | :---: |
| Automatic Run Mode | Auto Start Key Down | Run automatically using <br> the RACK TEST sequence |
| Operator Mode | Auto Start Key Up | Selected by the Operator |

In the automatic run mode;

1. The processor and memory tests contained in ROM are performed.
2. Binary test programs are loaded from the test cartridge.
3. The "automatic rack test" sequence of tests is run.

Refer to the individual tests for details on each test. Press the STOP key to exit the automatic run mode.

In the operator mode;

1. The tests contained in ROM are performed.
2. Press the STOP key to skip the memory tests.
3. Binary test programs are loaded from the data cartridge.
4. Select the test to be performed and refer to the appropriate section for test details.

## Note

Errors during any test in any mode will halt the test to preserve the error condition. Press the CONTINUE key to continue the same test. Press the STOP key to start another test.

## Using the Test ROM Only

When only the test ROM is installed, testing is limited to the tests contained in the test ROM. Initial turn-on or pressing the CONTROL STOP keys will initiate the automatic run mode.

Requirements using only the test ROM:

- Auto start key should be up.
- A known-good, blank cartridge should be installed in T15 or T14 if the cartridge tests are to be performed.

When the ROM's tests are complete, the read/write memory or the tape cartridge drives can be tested separately without the binary programs.

## Using the Test Binary Cartridge Only

Install the cartridge and press: LOADBIN "TBIN" EXECUTE. Two modes are possible depending on the position of the auto start key.

| Mode | Mode Determined By | Tests Are |
| :---: | :---: | :---: |
| Automatic Run Mode | Auto Start Key Down | Run automatically using the <br> automatic rack test sequence <br> Selected by the operator |
| Operator Mode | Auto Start Key Up |  |

Press the STOP key to exit the automatic rack test and enter the operator mode. The tests available on the cartridge are listed in Table XX.

## Processor/Memory Control Test

The processor/memory control test is run immediately after the test ROM receives control of the system. The test includes:

- Binary Instructions test.
- Input/Output Controller test.
- Mathematics Chip test.
- Memory addressing test.

An error will abort the test, preserving the error condition. If possible, error messages will be displayed. The computer beeps and displays:

```
PPU TESTED
LPU TESTED
BLK O SA-000040 EA-077777
```

when the test is complete.

## Initial Memory Test

The initial memory test is run automatically after the processor test. It tests the areas of memory needed to load and run the binary programs from the test cartridge.
Specifically:

- Unique block test determines if any block is answering to two block address.
- Block 1 PPU read/write test.
- Block 0 LPU read/write test.

An error will stop the test, preserving the error condition.
Press the STOP key to exit this test.

## ROM and Read/Write Memory Tests

## General Information

The test binary is originally loaded into block 0 . When memory tests are performed on block 0 , the binary is transferred into the next highest block available which has no error. If the binary cannot be transerred into another block, then "UNABLE TO TEST BLOCK 0 " is displayed.

The test binary uses block 1 for basepage read/write locations. When testing block 1 , these basepage locations are temporarily transferred to another block. If the transfer cannot be made, "UNABLE TO TEST BLOCK 1 " is displayed.

Part of block 1 is used by the display. When block 1 is tested, the display is lost. If an error in block one is found, it is displayed, however, this destroys the test conditions in block 1 and causes other errors.

## K1 Keyboard Test

This test is used to check all the keyboard keys and features for proper operation.
Before starting the test, all double-position keys like PRT ALL, AUTOST and SHIFT LOCK must be in the up position.

Press ${ }^{2} 1$;
If any of the double-position keys mentioned above are down, the display will tell you to release the key and then to press A .

If all the double-position keys are up, the CRT displays:

```
WHICH KEY TO START
    TO END PRESS +
```

Press the key that you wish to start the test with. Any key shown below may be selected. Then press that key again. The display tells you which key to press next.

After selecting a key to begin, press the keys in the sequence shown above. To end the test, press $+\dagger$. A bad key or a key pressed out of sequence will result in a beep and a message describing the key pressed in error. The key sequence described in Figure XX can be used for any keyboard option although the key caps and characters will be different.

If the spacebar is pressed as the first key, the test starts with the special keys (i.e., CONTROL, SHIFT LOCK, SHIFT).

If a bad key is found, restart the test and continue with the key after the bad key to test the rest of the keyboard.

The $\leftarrow \square \square \dagger \square$ keys have to be pressed lightly and then pressed down fully. Pressing the arrow keys down fully will check the repeat function of these keys. A continuous beep should be heard when these keys are fully depressed.

Test the REPEAT key by pressing a key and the REPEAT key at the same time. A continuous beep should occur.

## k2 Cartridge Drive Exerciser

Y Test Mode

## CAUTION

DO NOT USE THE 9845B/C TEST BINARY TAPE FOR THE READ, WRITE, MOTOR DRIVE, OR TAPE LOGIC TESTS. USE A SCRATCH TAPE.

## CRT displays TEST?

To write data on the blank tape cartridge, press these keys:
W CRT displays ENTER PATTERN FROM KEYBDARD On math keys, enter a 6 digit octal number, 000000 thru 177777.

CONTNUE Tape rewind, starts continuous writing on one track, erasing previously recorded data. At end of track, tape stops, but can be stopped at any time by pressing

STOP Stops writing data and stops tape movement.
To read data from the same tape, press these keys:
C Tape rewinds, reads data, CRT displays this message: LOW THRESHDLD READ DATA=DDDDDD wherein the D's should be the octal pattern used in the write test. If the write test was stopped before the entire track was written on, the octal pattern should change at the place the W test was stopped at. To change read threshhold to high, press H. Data read should be the same for both threshholds.

STOP Ends the read and tape drive operations and the CRT displays TEST?, you may press another letter key to repeat or start a new test.

Motor Drive Tests:

## CAUTION

THIS TEST CAN UNSPOOL THE TAPE, EOT/BOT DETECTION IS NOT USED. BE CAREFUL AND FOLLOW THESE DIRECTIONS.

Use the above read or write test to position the tape in the center of the track, each spool should have the same amount of tape. Read the following directions through once before you actually perform the test.

Press the following keys to perform the tape drive test:

## Note

Pressing the HOME or STOP keys will stop the motor.

Enables the tape drive test, the CRT displays
INSERT DUMMY CARTRIDGE
ENTER DIRECTION/SPEED
Place a scratch tape in the selected drive if not already done. If the tape is all on the left hand spool, it is rewound and should only be moved forward.
Pressing the left/right arrow display keys fully down will cause the drive motor to go fast; unless stopped, the tape will unspool and continue to drive. Pressing the display arrow keys half way down results in a slow drive speed. Pressing the arrow keys twice results in fast drive speed. Be careful you don't unspool the tape.

HOME or STOP will stop the tape drive.

| $\rightarrow \rightarrow$ | Pressed halfway down results in slow forward motion. |
| :--- | :--- |
| $\rightarrow \rightarrow$ | Pressed full down results in fast forward motion. |
| $\leftarrow$ | Pressed halfway down results in slow reverse motion. |
| $\square$ | Pressed fully down results in fast reverse motion. |

This test verifies the tape can move both directions and speeds.

## Tape System Logic Test:

Press the following keys and perform the indicated steps;

## T Starts the tape logic test, the CRT displays

REMOUE CARTRIDGE CONTINUE
Remove the tape cartridge from the drive, then press
CONTINUE This checks the cartridge in switch OUT position. To test the switch's IN position, the CRT prompts:

INSERT DUMMY CARTRIDGE CONTINUE
Place an unprotected scratch tape in the drive, then press
CONTINUE The computer tests the tape drive and logic circuits then the CRT displays the following message;

## INSERT CARTRIDGE CONTINUE

The T test is finished, insert the test binary cartridge and press the CONT key. Other tests can now be run.

## k3 Printer Test

This test checks the printer logic circuits and provides a printout to check for missing dots，print intensity and character alignment．

Press $k_{3}$ ，if paper is loaded in the printer the following printout occurs；

EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE Er．EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE
 EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE

```

## 

When the printout is completed，the CRT displays：

> PRESS STOP TO EXIT
> ENTER CHARACTER

At this point you can select a character to be printed for alignment or intensity purposes． Continuous rows of the selected character will be repeated until PAUSE or STOP is pressed．

Here is an example printout when $\mathbf{Z}$ is pressed．

[^4]If you wish to change the character that is being printed, simply press the desired key.
Pressing STOP whether a character was selected or not, ends the printer test.
Pressing PAUSE stops the printing; entering a character will begin printing again.
If a non-character key is pressed, E's are printed.
If the CONTINUE key is pressed, continuous rows of 560 dots are printed.
When printing the characters, the default page length of 70 lines is used.

## k6 Display Results

Pressing $\mathrm{k}_{6}$ displays option and test result information.

- Memory blocks not present in the computer are not displayed. The block numbers are octal. The addresses are octal word addresses.
- Other options are shown as "not present" if they are not installed.
- The number of times the test has been run is displayed in "Test Count". This number is decimal.
- The number of errors that occurred during a particular test is displayed in "Error Count" This number is decimal.

Here is an example k 6 display.

Press STORE to print the displayed information on the printer.
Press STOP to clear the display and to continue with the other tests.

## k7 Rewind T15

Pressing $\mathrm{k}_{7}$ rewinds a tape cartridge installed in the right-hand cartridge drive (T15).

## k8 Read/Write Memory Troubleshooter

This test allows you to select specific memory tests. If the SHIFT LOCK key is down, the test will not stop on an error.

More than one test can be selected. Here is a list of the available tests and the key to press to select each test.

The (M), A , B and Weys select different memory tests. Pressing the $\mathbf{P}$ key enters the "peek and poke" portion of the memory troubleshooter program. Peek and poke is described at the end of this test description.

| Press | Test |
| :--- | :--- |
| A | Marching Pattern - A test pattern is stored in memory. The first word <br> is read and verified and the complement of the test pattern is stored in <br> the first word. This sequence is continued for every word in the block <br> of memory. Once the pattern has been "walked up" memory, its <br> complement is walked down. The marching pattern test walks up and <br> down six different patterns. This test verifies that ones and zeros can <br> be stored in all memory cells, and checks for opens and shorts in data <br> bus lines. |
| Refresh - Zeros are stored in memory. The memory is left alone for <br> ten seconds and then verified. Ones are then stored in memory and <br> the sequence repeated. This test checks the refresh circuitry. |  |
| B $\quad$Byte - Zeros are stored in memory. Ones are then stored in the <br> right-byte using the byte operation. Memory is then verified. Zeros are <br> stored in memory and ones are stored in the left byte. Memory is <br> verified. The sequence is then repeated with ones stored in memory <br> and zeros stored in left and right bytes. This test checks memory byte <br> operations. |  |
| Walking bit (ones and zeros) - Every cell in a byte half block of <br> memory is set to zero. A one is written in the first cell, and all other <br> cells are read to verify that it is still one. The tested cell is then restored <br> to a zero and the next cell is set to a one. All cells are again read to <br> verify their contents. The sequence is continued for every cell in the <br> block. Its complementary pattern walking zeros completes the test. <br> Each 64k block is tested, 32k bytes at a time. This test checks for <br> memory cell row and column interactions. This test takes about six <br> hours to test each 64k byte block of memory. |  |

Select the tests in the order you want them to run; then press CONTINEE. If no tests are specified all the tests will be run.

Enter the octal block address of the memory block to be tested and press CONTNUE. If the specified block is not present, BLK NOT PRESENT is displayed. Press CONTNUE to enter another block address. If no block address is entered, the default is to test all blocks of memory.

Press A to test all blocks.

Once a block address has been entered, enter one of the following keys to select which portion of the block is to be tested.

| Key | Selects the |
| :---: | :--- |
| $U$ | Upper 32k bytes (addresses 40000-77777) <br> Lower 32k bytes (addresses 00000-37777) |
| T | Test full block (addresses 00000-77777) |

## Note

Since block 1 is only $32 k$ bytes, block 1 testing is automatic (if selected) without the above block portion selection.

Then press CONTINUE to start the test.
Blocks are continuously tested. The block number and the starting and ending addresses are displayed (no display during block 1 testing).

Press STOP to exit the test.
Memory errors are displayed with the following format:
MEMORY ERROR BLK BB ADDRESS AAAAAA HAS XXXXXX NOT YYYYYY

## BB- Octal block number

AAAAAA- Octal memory address
XXXXXX- Actual octal data
YYYYYY- Expected octal data
To recover from an error:
Press CONTINE to continue with the next address.
Press $A$ to continue testing with the next block.
Press STOP to exit the test.
After recovering from an error, the inverse video on the error message is turned off.

## Peek and Poke

This feature allows you to read data from a specified memory location and to write data into a specified memory location.

6 digit octal addresses are accepted, in the range 000040-177777.
Locations 0 through 37 in any block should not be written into. These locations correspond to processor register numbers. Accessing these locations may stop the mainframe activity.

The test binary and the basepage can be destroyed by writing in the blocks that contain them (usually blocks 0 and 1). Read address 000033 for the current binary block and address 000036 for the current basepage block.

Press $\mathbf{P}$;
To read the contents of a memory location use this syntax; example Address 123456 , Blk 4 123456;4 EXECUTE

To write into a memory location use this syntax;

$$
123456 ; 4=177777 \text { EXECUTE }
$$

To write or read continuously, include a / after the pattern: 123456;4/
Multiple statements can be executed by separating them with a comma: 123456;4, 123457;4, 123460;4

## k9 Read/Write Memory Test

This test performs marching pattern, refresh and byte tests on a selected memory block. Enter the octal block number and press CONTINEE.

If 100000 is entered, all even blocks are tested.
The block starting address and ending address are displayed. The block is continuously tested until STOP is pressed. Errors are treated as described in the memory troubleshooter.

## k10 Choose Rack Test Sequence

This test allows you to arrange and set up your own rack testorder.

## Note

The tests are performed only if the options are installed, otherwise, the tests are skipped. Likewise, if the printer has no paper the printer test will not be performed and if a tape cartridge is not installed the cartridge drive test will not be performed.

Disconnect all interfaces from the computer during this test.
When k 10 is pressed, the sequence of desired tests can be entered. Here is a list of the tests and the key to press to select each test.

| Keys to Press | Test |
| :---: | :--- |
| G | Graphics memory test |
| M | Read/Write memory test |
| O | Optional T14 Cartridge test |
| P | Printer test |
| R | System and Option ROMchecksum test |
| T | T15 Cartridge test |
| B | A30 Fast LPU only |
| L | Light Pen Test (98775A) |

Up to ten choices can be entered. After the tenth choice, testing is automatic.
Press CONTINEE to start the rack test sequence.
Press $\mathbf{S}$ to skip a test and continue with the next test.
Press STOP to exit the test.
When STORE is pressed after the test is running, information displayed on the CRT is printed if the printer is installed.

## k10 ROM Checksum Test

The ROM checksum test is a part of the k 10 choose rack test and the k 11 automatic rack test. The contents of each option and system ROM are read and a checksum for each ROM is computed. If the checksum for a particular ROM is all zeros, the ROM is not there. If the checksum is all ones, the ROM is correct. If the checksum is other than all ones or zeros, a checksum failure is displayed in the following form.

ROM LHELKSUM FAILURE BLK $X$ ADDRESS YYYYYY - ZZZZZZ
$\mathrm{X}=$ the octal block number
YYYYYY = the ROM starting address
$Z Z Z Z Z Z=$ the ROM ending address
Press CONTINUE to continue the test after an error occurs.
Refer to memory map for ROM locations.
Refer to the appropriate sections in this chapter for test descriptions.

## k11 Automatic Rack Test

This test is used to exercise the computer over an extended period of time. The k11 rack test runs the following tests continuously.

- System and Option ROM checksum test
- Graphics memory test
- Tape cartridge exerciser tests (T15 and T14)
- Printer tests
- Read/write memory tests ${ }^{1}$

## Note

The tests are performed only if the options are installed, otherwise, the tests are skipped. Likewise, if the printer has no paper the printer test will not be performed and if a tape cartridge is not installed the cartridge drive test will not be performed.

Press S to skip a test and continue with the next test. This test starts automatically if the auto-start key is depressed when the computer is switched on or power is recycled. Refer to the appropriate section in this chapter for test descriptions.

## k15 Run Operating System

This special function allows you to return to normal computer operation. When using only the test binary cartridge, press $\mathrm{k}_{15}$ to exit the tests and return to the 9845 operating system. Before returning to the system, however, the LPU/PPU is tested for BASIC language functions. Directions and prompts are displayed on the CRT.

If ROM checksum errors occur, or if the system ROMs are not present, the following error message is displayed:

> WILL NOT JUMP TO SYSTEM. ROMERROR

Press any key after an error to exit this routine.

## k15 Return To Operational System, 9845B/C Opt. ZXX

| Note |
| :---: |
| This test is the only valid bit-slice processor test. |

When the k15 return to system SFK is pressed and the AUTOST key is latched, the LPU processor and ROM checksum tests are performed. At that point, an AUTOST file is brought in to run the BIT-SLICE processor tests as desired.

Entry point for the Bit Slice Microcode test is either from k15 by answering yes to conduct bit slice microcode tests, or by doing a LOAD "AUTOST", 1 with TBIN in.

## Note

If the AUTOST key is unlatched, the message "Autost must be latched before returning to the system" is displayed. When the AUTOST key is latched the Autost file will be brought in.

If CTL STOP is pressed after the $9845 \mathrm{~B} / \mathrm{C}$ has returned to normal operation and the Test ROM is installed, the Test ROM turnon test will run and the mainframe is back in the diagnostic mode.

## 9845B/C Mainframe Adjustments

## Chapter

## Adjustments

Special tools are not required for any mainframe adjustments.

## Adjustments to the Thermal Printer

Instructions:

1. Turn off the $9845 \mathrm{~B} / \mathrm{C}$ and disconnect the power cord.
2. Remove the printer paper, CRT and shell.
3. Remove the bezel and use the service bracket to hold the bezel in the upright position.Do not disconnect the wiring.
4. Loosen the 2 adjustment lock screws on either side of the print head, located in the adjustment cams.
5. Install the CRT, printer paper, and power cord.
6. Turn on the $9845 \mathrm{~B} / \mathrm{C}$ and advance enough printer paper to extend back over the rear of the base.
7. Run any one of the following tests:
a. 9845B/C System Exerciser, PRNTR.
b. $9845 \mathrm{~B} / \mathrm{C}$ Diagnostic, k 3 .
c. Key in and run a program to continuously print 80 characters.
8. Adjust the cams for darkest print across the entire width of the printing area.
9. Tighten the lock screws on the adjustment cams and run the test program again to verify correct adjustment.
10. Turn off the $9845 \mathrm{~B} / \mathrm{C}$ and remove the CRT and printer paper.
11. Install the shell, bezel assembly, and printer paper.
12. Return the $9845 \mathrm{~B} / \mathrm{C}$ to normal operation.

## Hardware Compatibility Information

This information lists various peripheral devices supported by HP for the 9845B/C Desktop Computers. ROM names, part numbers, revisions, and memory locations are referenced. Some software information is also provided. The Service Note referencing the data is shown in parentheses.

Running the ROMREV test (9845B/C System Exerciser \#2) can list the current configuration of the $9845 \mathrm{~B} / \mathrm{C}$ mainframe.

1. Mass Memory Devices.

I See also 98028-90039 Disc Drive CE Handbook Section.
a. Hard discs 7906/7920/7925. These discs require the following:

1. Revision E or later backplane (9845B/C-7).
2. Revision B or later Block 5 Address 20 K ROM pair ( $9845 \mathrm{~B} / \mathrm{C}-5$ ).
3. Revision D or later Block 5 Address 40K ROM pair (9845B/C-5).
4. Revision D or later Block 5 Address 60K ROM pair (9845B/C-5).
5. Revision B or later Block 3 Address 0K ROM pair (9845B/C-3).
6. Revision B or later Mass Storage ROM 98413A/B, (9845B/C-10).
7. 98041 A Disc Interface, one per mainframe.
8. 12745B/13037A Disc Controller with HPIB interface.
9. Limited to one 98041 per mainframe with one 79 xx master per 98041A and up to three 79 xx slaves, or two 79 xx slaves plus one 7970 E .
b. 7910 H and 9895 discs. These discs require the following:
10. $98034 \mathrm{~A} / \mathrm{B}$ Revised HPIB interface ( $66501 / 66502$ boards Rev E or later, or 66503/66504 boards all Revs).
11. Revision B or later Block 5 Address 20K ROM pair (9845B/C-5).
12. Revision D or later Block 5 Address 40K ROM pair (9845B/C-5).
13. Revision B or later Block 3 Address OK ROM pair (9845B/C-3).
14. Revision C or later Mass Storage ROM 98413B, (9845B/C-10).
15. Only mass storage devices on the 98034A/B card (i.e. 9895/7910 combinations).
c. 7970E Tape Drives. These drives require the following:
16. The 7970 E must be an option 826.
17. Revision E or later A02 assembly (9845B/C-7).
18. 98041A Disc Interface.
19. 09845-15524 Tape Utilities Revision C or later for EBCDC.
20. No more than one 7970E per 98041A, may also have a hard disc on the same 98041A. (Max configuration is 98401A, 79xxM, 79xxS, 79xxS, 7970E.
21. Mass Storage ROM is NOT required for the 7970E.
d. $9885 \mathrm{M} / \mathrm{S}$ Flexible Disc Drives. These drives require the following:
22. 98032 A requires one shot timing changes ( $9845 \mathrm{~B} / \mathrm{C}-8$ ).
23. $9885 \mathrm{M} / \mathrm{S}$ requires A4 board changes ( $9885 \mathrm{M} / \mathrm{S}-4 \mathrm{~A}, 9885 \mathrm{M} / \mathrm{S}-5 \mathrm{~A}$ ).
24. Revision B or later Block 5 Address 20 K ROM pair ( $9845 \mathrm{~B} / \mathrm{C}-5$ ).
25. Revision D or later Block 5 Address 40K ROM pair (9845B/C-5).
26. Revision D or later Block 5 Address 60K ROM pair (9845B/C-5).
27. Revision B or later Block 3 Address 0 K ROM pair ( $6845 \mathrm{~B} / \mathrm{C}-3$ ).
28. Revision $A$ or later Mass Storage ROM. (Revision B or later if DBM ROM is installed.) (9845B/C-10.)
e. Internal Tape Drives. These drives require the following:
29. Revision B or later Block 5 Address 20K ROM pair (9845B/C-5).
30. Revision D or later Block 5 Address 40 K ROM pair ( $9845 \mathrm{~B} / \mathrm{C}-5$ ).
31. Revision D or later Block 5 Address 60 K ROM pair ( $9845 \mathrm{~B} / \mathrm{C}-5$ ).
32. Revision B or later Block 3 Address 20K ROM pair (9845B/C-3).
33. Mass Storage ROM is NOT required.

## 2. Printers.

a. Internal Printer.

1. Requires printer option including A 52 or A 55 , and A 51 assemblies plus the printer bucket. Note that A51 has the printer character ROM (currently Revision A).
2. Hardware compatibility considerations: Printheads manufactured after 1978 are NOT compatible with the the A52 board (09845-66552) and must be used with an A55 board (09845-66555). (9845B/C-2.)
b. External printers will work for lists etc., using PRINTER IS syntax, for full capabilities they require an I/O ROM; all Revisions are okay (LPU presently is A, PPU presently is C).
c. H-P Supplied Printers information:
3. $2631 \mathrm{~A} / \mathrm{G}$; HP supports only the HPIB version on a $98034 \mathrm{~A} / \mathrm{B}$. The 2631G version requires a Graphics ROM and the graphics support boards.
4. 9876 A ; HP supports either the HPIB version, or the GPIO version with a 98034A/B or 98032A Opt. 076 respectively. DCD does NOT support the serial version on Desktops due to handshake difficulties with the 98036A card. Graphics capabilities require a Graphics ROM and the graphics support boards.
5. 9871 A ; HP supports the HPIB version with a $98034 \mathrm{~A} / \mathrm{B}$, or the GPIO version with a 98032A Opt. 071.
6. 2608A; Requires Graphics ROM and Graphics support boards in the mainframe. HPIB is the only interface supported on 9845B/C with the 98034A/B. Note that the HPIB control board 02608-60026 on the 2608 must have jumpers in locations WT1 to WT2, WT3 to WT4, and WT5 to WT6.
7. Plotters and Digitizers.
a. HP Plotters.
8. Require either the IO ROM pair, or the Graphics ROM; with a 98034A/B. Graphics ROM must be Revision B or later (9845B/C-5).
9. The plotters can be driven using "HPGL" syntax with IO ROM.
10. 8 pen plotters require either the Revision C 09845-65517 Graphics ROM with the "PLOTTER IS 7,5, '9872A"' syntax, or Revision A or later of the Enhanced Graphics ROM 98780-65501 with the "PLOTTER IS 7,5, 'HPGL"' syntax.
11. The use of other syntax or ROM revisions will only support 4 pen operation, as the operating system will do a modulus 4.
b. Non H-P Plotters. These plotters use the Graphics ROM with a $98034 \mathrm{~A} / \mathrm{B}$ and the "INCREMENTAL" syntax. Note that an I/O ROM can be used in place of the Graphics ROM if appropriate software drivers are written. The graphics ROM, if used, should be Revision B or later (9845B/C-10).
c. Digitizers. These use the $98034 \mathrm{~A} / \mathrm{B}$ and the IO ROM pair.
12. HPIB Instruments.
a. Data Acquisition Systems. These systems (usually multiprogrammer based) require a Revised HPIB interface ( $98034 \mathrm{~A} / \mathrm{B}$ ). If the 98034 interface has a $66503 \operatorname{Rev} A$ or B, or a 66501 Rev E or F board, then the internal HPIB address of the card should be changed from the factory default of 21 to a non-parity generating address such as 20 . Some kind of software driver has to be written for these cards to recover from an occasional invalid setting of the SRQ line. Interfaces with 66503 Rev C and later can utilize any HPIB address and do not require the software driver.
b. Secondary Addressing. Option 2XX models of the 9845B/C do not support secondary addressing in the same manner as option 1XX models. Option 2XX models require the use of SENDBUS syntax to prevent the sending of an unintentional secondary command of 0 and to allow sending of any other value secondary command.
c. All 9845B/C models require the use of a Revised HPIB interface.
d. HPIB bus configuration commands result in a different sequence of operations on ENTER or READ BIN than done by a 9825 . SENDBUS syntax can be used in those situations where a peripheral is sequence dependent (such as utilizing a secondary command sequence to get the status of a 2631 printer).
13. Graphics/Plotters.
a. 9845 B Option 1XX. This option requires: (9845B/C-10A)
14. Graphics ROM 09845-65517 Revision C or later to support 8 pen plotters and DSN/DL. This ROM requires mainframe ROM pair 1818-0835 and 1818-0831.
15. Left Support A3 (09845-66503).
16. Graphics Scanner A77 (09845-66577).
17. Graphics Memory A79 (09845-66579).
b. 9845 B Option 2 XX . This option requires: ( $9845 \mathrm{~B} / \mathrm{C}-10 \mathrm{~A}$ ).
18. Enhanced Graphics ROM 98780-65501 Revision A or later with mainframe ROM pair 1818-1591 and 1818-1592.
19. Alpha Control A34 (98770-66534).
20. 98780 A Fast Monochromatic CRT.
c. 9845 C Option 1XX. This option requires: (9845B/C-10A).
21. Either Enhanced Graphics ROM 98780-65501 Revision A or later with mainframe ROM pair 1818-1591 and 1818-1592; or Color Graphics ROM 9877065501 any revision with mainframe ROM pair 1818-1208 and 1818-1209. The Enhanced Graphics ROM trio is the preferred configuration. NOTE that the mainframe ROM pairs match up with a specific Graphics option ROM and cannot be mixed.
22. Alpha Control A34 (98770-66534).
23. 98770 A Color CRT.
d. 9845 C Option 2XX. This option requires: ( $9845 \mathrm{~B} / \mathrm{C}-10 \mathrm{~A}$ ).
24. Enhanced Graphics ROM 98780-65501 and mainframe ROM pair 1818-1591 and 1818-1592.
25. Alpha Control A34 (98770-66534).
26. 98770 A Color CRT.
e. 9845B Option 1XX with 98403A Fast Processor Upgrade Kit. This option requires: (9845B/C-10A).
27. Graphics ROM 09845-65517 and mainframe ROM pair 1818-0835 and 18180831.
28. Left Support A3 (09845-66503).
29. Graphics Scanner A77 (09845-66577).
30. Graphics Memory A79 (09845-66579).
31. Assembly Development and Executing ROM.

This ROM requires a PPU processor board with an AEC chip manufactured after July 1979 (9845B/C-10).
7. DBM ROM. Use of this ROM requires the following configuration:
a. Revision C or later IO ROM (PPU side) (9845B/C-10).
b. Revision D or later Block 5 Address 40K ROM pair ( $9845 \mathrm{~B} / \mathrm{C}-5$ ).
c. Revision B or later Mass Storage ROM for all mass storage devices except 9895, which requires Revision C or later (9845-10).
d. If the mass storage device is a 9885 , then the following is required:

1. 98032 A must have correct one shot timing ( $9845 \mathrm{~B} / \mathrm{C}-8$ ).
2. $9885 \mathrm{M} / \mathrm{S}$ must have A 4 board changes per $9885 \mathrm{M} / \mathrm{S}-4 \mathrm{~A}$ and -5 A .

7-6 9845B/C Peripherals

## 9845B/C Mainframe Replaceable Parts

## Chapter 8

## Repair Philosophy

The 9845B/C mainframe assemblies are divided into those that can be exchanged ( X ) and those that can be repaired ( R ) or discarded in the field. This table identifies each mainframe assembly by its assembly number and field repair philosophy. Comments relating to the assembly are given where necessary.

9845B/C Service Kits:
9845B/C mainframe and options seruice kits are shown below in a table. Percentage ualues reflect the amount of failures each kit should correct. An 81-93X kit is 93X effective when used with the 0-80X kit; the 94-99\% kit is therefore effective when used with both the 0-80x and 81-93x kit.

| PRODUCT | DEFINITION | PART NUMBER |
| :---: | :---: | :---: |
| 98458 | 0-80\% FSI | 09845-67197 |
|  | 81-93X FSI | 09845-67198 |
|  | 94-99\% FSI | 09845-67199 |
|  | PSP, Tools | 09845-67100 |
| 9845 C | 0-80\% FSI | 98770-67198 |
|  | 81-99X FSI | 98770-67199 |
|  | PSP, Tools | 98770-67100 |
| 98.780A | 0-80\% FSI | 98780-67197 |
| 9845B/C, Opt.2XX | 0-80\% FSI | 09845-67200 |

## FSI/PSP Cross Reference

This table is a sequential listing of all spare parts and service items showing the kits they're available in. Some items are stocked in two or more kits. Part numbers on the left, the availability columns list the product, option \#, alpha level, percent, and kit part number.

## 8-16 9845B/C Mainframe Replaceable Parts

## Memory Map

## 9845B/C Memory Architecture

Each address is a 16 bit word ( 2 bytes).
Blocks have 32k addresses, or 64 k bytes.
Some blocks don't use all 32 k addresses.
Even blocks (and 1) are RWM.
Odd blocks (except 1) are ROM.
Here's how this memory map is laid out;
Down the left column:
Block numbers (octal) and the assembly the memory is in.
If the memory is standard, an S ; if optional, an 0 .
Across the top:
Addresses (octal) is $10 \mathrm{k} / 20 \mathrm{k}$ ranges across the top.
Data in the map:
The information in that block/address range of memory. If ROM, it's processor, use and option ROM product number. ( N ) Numbers in parentheses refer to notes at the end of the map. Empty areas either don't exist or are not presently used.

A complete list of system and option ROMs, with revisions and part numbers is available by listing on the printer, the 9845B/C System Exerciser Tape \#2, the ROMREV file starting with line 5190.

## Notes (shown in parentheses in memory map)

1. Addresses $0-37$ in each block are common processor addresses. RWM and ROM use addresses 000040-177777.
2. This location is ROM for CRT graphics. See parts list for details.
3. More CRT ROM, the parts list shows specifics.
4. These are the keyboard language ROMs, six sets exist for six languages. Refer to parts list for specifics.
5. Two optional graphics ROMs are available, 98411A, for the standard CRT, addresses 030000-047777.
98411B, for enhanced and/or color CRT, addresses 030000-067777.
Special Note on Block 0 RWM Allocations:
Block 0 contains the following map at execution time,
If no A26 optional RWM assemblies are installed,
Address 177777 Block Descriptor
System RWM
LPU System RWM
Option ROM RWM
Binary Programs Area
Execution Stack
Buffer Space
Program Segments
Value Area
COM System Common
ICOM Assembly Common

Address 000040 CCOM Datacomm Common
If one or more A26 optional RWM assemblies are installed, Block 0 contains
Address 177777 Block Descriptor LPU System RWM (approximately 9k bytes)
Option ROM RWM
Binary Programs Stack
Execution Stack
Address 000040 Buffer Space
Highest A26 Block (6, 12, or 16) contains
Address 177777 Block Descriptor
Program Segments
Value Area
COM System Common
ICOM Assembly Common
Address 000040 CCOM Datacomm Common

## Processor Section

The Processor/Memory Control section consists of:

Fast Language Processor Block Diagram, A30

## Memory Section

The read/write memory and read-only memory assemblies that make up the memory section are:

1 These ROMs are different when A27 is used with the 98780A Enhanced Graphics CRT

## Cartridge Drive Section

The cartridge drive section contains the following assemblies:

Tape Cartridge Block Diagram

## Keyboard Section

The keyboard section is made up of the following assemblies, all of which are attached to the keyboard bezel.

Keyboard Block Diagram

## Printer Section

The printer section contains the following assemblies:

Printer Block Diagram
$\qquad$

All key cap part numbers are prefixed by 0371 -

Use these drawings for key cap part numbers and correct key cap locations. Part numbers for all the ASCII keyboard key caps are given. For the other language keyboards, the part numbers for the unique key caps (key caps different from the ASCII keyboard) are given. If no key cap number appears above a particular key cap, refer to the same key on the ASCII keyboard for the part number. The actual position of the key cap on the keyboard (compared to the ASCII keyboard) will vary according to the language.

French Keyboard

## Error Messages

## Mainframe Errors

Missing ROM or configuration error. Also, check to see if all option ROMs are installed properly.

Memory overflow; subprogram larger than block of memory. Also check to see if your arrays are too large to fit in memory.
Line not found or not in current program segment. Check the spelling of line labels and line identifiers.
Improper return. Branched into the middle of a subroutine.
Abnormal program termination; no END or STOP statement.
Improper FOR/NEXT matching.
Undefined function or subroutine. Check spellings.
Improper parameter matching. Check the parameter lists in SUB and CALL, and DEF FN and FN statements to see if they match in number and type.
Improper number of parameters. Check the number of arguments used in an FN or CALL reference.
String value required.
Numeric value required.
Attempt to redeclare variable. Once a variable name has been declared in a DIM, COM, REAL, SHORT or INTEGER statement, it can't be redeclared in that program segment.
Array dimensions not specified. You must dimension the array, either explicitly or implicitly.
Multiple OPTION BASE statements or OPTION BASE statement preceded by variable declarative statements.
Invalid bounds on array dimension or string length in DIM, COM, REAL, SHORT or INTEGER statement. Strings can't be longer than 32767 characters. The range of array subscripts is -32767 through 32767.
Dimensions are improper or inconsistent; more than 32767 elements in an array. Check for wrong number of subscripts in an array reference. Check any matrix multiplication for proper sizes.
Subscript out of range.
Substring out of range or string too long. Check substring specifiers against length of string.
Improper value. Check numbers being entered, especially their exponents.
Integer precision overflow. The range is -32768 through 32767 .
Short precision overflow. Short-precision numbers have six significant digits and an exponent in the range -63 through 63.
Real precision overflow. Full-precision numbers have twelve significant digits and an exponent in the range - 99 through 99.
Intermediate result overflow.
TAN ( $n^{*} \pi / 2$ ), when $n$ is odd.

Magnitude of argument of ASN or ACS is greater than 1.
Zero to negative power.
Negative base to non-integer power.
LOG or LGT of negative number.
LOG or LGT of zero.
SQR of negative number.
Division by zero; or X MOD Y with $Y=0$.
String does not represent valid number or string response when numeric data required. Check any use of VAL function and its argument. Check for correct spelling of variable name.

Improper argument for NUM, CHR\$, or RPT\$ function.
Referenced line is not IMAGE statement. Check the line identifier in the PRINT USING statement.
Improper format string.
Out of DATA. Make sure READ and DATA statements correspond. Use RESTORE if appropriate.
EDIT string longer than 160 characters. Try using a substring.
I/O function not allowed. TYP and other I/O functions aren't allowed in any I/O statement like DISP or PRINT. Place the value into a variable.
Function subprogram not allowed. An FN reference isn't allowed in any I/O statement, or in redim subscripts. Place the value into a variable.
Improper replace, delete or REN command. SUB and DEF FN can only be replaced by another SUB or DEF FN. They can only be deleted if the rest of the corresponding subprogram is deleted. A renumbering may cause out-of-range line numbers if completed, so an error occurs; check increment value.
First line number greater than second.
Attempt to replace or delete a busy line or subprogram. Typically, this is caused by trying to delete an input statement that is still requesting values.
Matrix not square. The dimensions of an identity matrix or of one used to find an inverse or determinant must be the same size.
Illegal operand in matrix transpose or matrix multiply. The result matrix can't be one of the operands.
Nested keyboard entry statements.
No binary in memory for STORE BIN or no program in memory for SAVE. Check line numbers in SAVE against program in memory.
Subprogram COM declaration is not consistent with main program. Check number, type and dimensions of variables.
Recursion in single-line DEF FN function. Only subprograms can be called recursively.

Line specified in ON declaration not found.
File number less than 1 or greater than 10.
File not currently assigned. Execute an ASSIGN statement for the file, or check the accuracy of the file number used.
Improper mass storage unit specifier. Check the values of the select code, unit code and controller address.

53 Improper file name. A file name can have 1-6 characters and can't contain a colon, quote mark, NULL or CHR\$(255).
Duplicate file name. Choose another name or PURGE the old one.
55 Directory overflow. There is a maximum number of files that a mass storage medium can hold. A file will have to be removed to add another.

File name is undefined. Check the spelling.
Mass Storage ROM is missing. Check to see that the ROM is installed properly.
Improper file type. Use LOAD for PROG files, ASSIGN and GET on DATA files and LOADKEY for KEYS files.
59 Physical or logical end-of-file found. Attempting to READ\# or PRINT\# past the end of the file. Compare the data list to the file size.
Physical or logical end-of-record found in random mode. Compare the data list to the record size.
G 1 Defined record size is too small for data item. You can either PURGE and RE-CREATE the file with longer records or regroup the data being recorded.
File is protected or wrong protect code specified. Check to see that the protect code is included and spelled properly.
The number of physical records is greater than 32767 . That's the limit; use something smaller.
Medium overflow (out of user storage space). A file can't be set up because there isn't enough space. Use another medium or purge unwanted files.
Incorrect data type. You can't use GET on a DATA file that doesn't contain a program. Use TYP to find out what kind of data the computer is trying to be read.
Excessive rejected tracks during a mass storage initialization. The medium can't be initialized. If the medium is a flexible disk, use a different one. If the medium is a hard disc, call your HP Sales and Service Office for assistance, to determine whether there has been a hardware failure.
Mass storage parameter less than or equal to 0 . Check values of variables. Record numbers, record lengths and number of defined records must be positive numbers.
Invalid line number in GET or LINK operation. Check line numbers. May be trying to LINK to file that doesn't contain a program.
Format switch on the disc off. Turn it on.
Not a disc interface. Check mass storage unit specifier.
Disc interface power off. Turn it on.
Incorrect controller address, controller power off, or disc time out. Check mass storage unit specifier; make sure controller is on.
Incorrect device type in mass storage unit specifer.
Drive missing or power off.
Disc system error, type $\mathrm{I}^{1}$.
Incorrect unit code in mass storage unit specifier.
Disc system error, type $\mathrm{II}^{1}$.
1 See the Mass Storage Techniques Manual.

78-79 Reserved for future use.
80 Cartridge out or door open. Also check to see if interface is connected properly.
Mass storage device failure. Possible power failure.
82 Mass storage device not present. Check mass storage unit specifier.
83 Write protected Check the write-protection device on the medium or drive.
84 Record not found. There is a bad spot on the medium.
85 Mass storage medium is not initialized.
86 Not a compatible tape cartridge.
87 Record address error; information can't be read. Hardware failure. Check for a dirty read head.
88 Read data error. Hardware failure. Check for a dirty read head.
89 Check read error.
90 Mass storage system error.
91-99 Reserved for future use.
100 Item in print using list is string but image specifier is numeric.
101 Item in print using list is numeric but image specifier is string.
102 Numeric field specifier wider than printer width.
103 Item in print using list has no corresponding image specifier.
104 ON KBD or TOPEN not allowed in subprogram.
105-109 Reserved for future use.
110 Plotter type specification not recognized. Check spelling of "GRAPHICS", "9872A" or "INCREMENTAL".
111 Plotter has not been specified. Check select codes.
112 No graphics hardware installed in the System 45B.
113 LIMIT specifications out of range.
$114 \quad 98036$ card improperly configured.
115 TDISP not allowed unless peripheral keyboard active.
116 TOPEN is active on another select code.
117-149 Reserved for future use.
150 Improper select code.
151 A negative select code was specified that does not match present bus addressing.
152 Parity error.
153 Either insufficient input data to satisfy enter list, attempt to ENTER from source into source or enter count exhausted without linefeed.
154 Integer overflow, or ENTER count greater than 32767 bytes or 16383 words.
Invalid interface register number. (Can only specify 4-7.)
156 Improper expression type in READIO, WRITEIO, or STATUS list.
157 No linefeed was found to satify / ENTER image specifier, or no linefeed record delimiter was found in 512 characters of input.

158 Improper image specifier or nesting image specifiers more than 4 levels deep.
159 Numeric data was not received for numeric enter list item.
160 Repetition of input character more than 32768 times.
161 Attempted to create CONVERT table or EOL sequence for source or destination variable which is locally defined in a subprogram.
162 Attempted to delete a nonexistent CONVERT table or EOL sequence.
163 I/O error, such as interface card not present, device timeout, interface or peripheral failure (Interface FLAG line $=0$.), stop key pressed or improper interface card type.

167 Interface status error, TRL Character or an EOI was received on an HP-IB Interface before ENTER list or image specification was satisfied.
168-183 Reserved for future use.
184 Improper argument for OCTAL or DECIMAL function or assembled location.
185 Break Table overflow.
186 Undefined BASIC label or subprogram name used in IBREAK statement.
187 Attempt to write into protected memory; or, attempt to execute instruction not in ICOM region.
188 Label used in an assembled location not found.
189 Doubly-defined entry point or routine.
190 Missing ICOM statement.
191 Module not found.
192 Errors in assembly.
193 Attempt to move or delete module containing an active interrupt service routine.

194 IDUMP specification too large. Resulting dump would be more than 32768 elements.
195 Routine not found.
196 Unsatisfied externals.
197 Missing COM statement.
198 BASIC's common area does not correspond to assembly module requirements.
199 Insufficient number of BASIC COM items.
200-206 Reserved for future use.
207 Binaries not allowed in LOAD SUB file. Do LOAD, SAVE, SCRATCH A, GET and STORE on the file to get rid of binaries. However, the loaded program may not run after the binaries are removed.
208 Volume not mounted. Mount it and execute a VOLUME DEVICES ARE statement.

209 Operation not allowed on tape. Only the BKUP file used in DBBACKUP and DBRECOVER is allowed on tape.
$210 \quad$ Bad status array. It must be defined as integer precision with $\geqslant 10$ elements. Check spelling and current size.
211 Improper data base specified or data base not open. Improper name, or performing data base operation with invalid name.

212 Data set not found. Check set name or number and make sure it is on the volume specified in the schema.

213 Reserved for future use.
214 Data base requires creation. Perform a DBCREATE.
215-217 Reserved for future use.
$218 \quad$ Volume name not part of data base. Check spelling.
219 Out of available memory for a DBOPEN, DBBACKUP or DBRECOVER. Out of read/write memory if executed from main program. Out of special area if executed from subprogram, so perform the DBOPEN in the main program.
220 Improper or illegal use of maintenance word. Check spelling and leading or trailing blanks.

221 Data set not created.
222 Reserved for future use.
223 Improper backup file. In DBRECOVER, backup file has incorrect information in header or no primary DBBACKUP/RECOVER currently in progress (for secondary operation).

224 Incomplete backup file. More than one volume in backup; probably mounted in the wrong order. Start the recovery over.
225 Improper utility version number in root file. Rerun Schema Processor to generate new root file.

226 Corrupt data base - must purge and redefine. Purge root file and run Schema Processor.

227 Corrupt data base - all sets require erasure.
228 Data sets cannot be re-created without root file.
229 Operation not allowed while DBOPEN current. Perform a DBCLOSE mode 1.
230 Improper set list in DBBACKUP, DBCREATE, DBERASE, DBPURGE or duplicate sets in the set list.

231-232 Reserved for future use.
233 Required data set root file not mounted. Mount it and perform a VOLUME DEVICES ARE.

234 Referenced line not a PACKFMT statement. Make sure line identifier is correct and that it references a PACKFMT statement.

235 Reserved for future use.
236 Insufficient length in a PACK statement, or insufficient current length in an UNPACK. Insufficient length in a DBBACKUP or DBRECOVER statement.
237 List length > 32767 in PACK or UNPACK. Array in PACKFMT too large. Make sure it is the correct variable; redimension if necessary.

238 Numeric conversion error. Improper real number found. Check PACKFMT to make sure a REAL or SHORT variable, not INTEGER is being unpacked.

239 UNPACK requires a source string of greater length.
240-299 Reserved for future use.
$300 \quad$ CCOM area not allocated
301 Not allowed when channel is active
302 CMODEL statement required
303 Not allowed when trace is active
304 Too many characters in CWRITE
305 New CCOM size not allowed when channel is active
$305 \quad 98046$ card failure
307 Insufficient CCOM allocation
308 Illegal character in CWRITE of non-TRANSPARENT data
309 Not allowed for this CMODEL
$310 \quad$ CCONNECT statement required
$311 \quad$ Not allowed while Data Comm is suspended
312 Improper CSTATUS array
313-329 Reserved for future use.
330 Lexical table size exceeds array size.
331 Improper pointer array'.
332 Non-existent dimension specified in MAT REORDER.
333 Pointer array contains out-of-range subscript value.
334 Pointer array length does not equal number of records.
335 Pointer array is not one-dimensioned.
336 Number of records (plus twice the number of secondary keys plus twice the number of substrings) exceeds 16383.
337 Subscript extends beyond dimensioned maximum length.
338 Subscript out-of-range in key specifier.
339 Starting location is an out-of-range subscript value.
340 Lexical table is too small to include all characters.
341 Main lexical table length plus mode section length does not equal specified table length.
$342 \quad$ Array is not one-dimensioned or is not integer.
343 Lexical mode section pointer out-of-range.
344 Lexical table length exceeds 16383.

[^6]System Error octal number; octal number
This error indicates a malfunction in the machine's firmware system. Contact your Sales and Service Office.

## I/O Device Errors

Two error messages can occur when attempting to direct an operation to an I/O device that is not ready for use. A printer which is out of paper or no device at a specifed select code are examples. The first message that appears is -

## I/O ERROR ON SELECT CODE select code

If the condition is not corrected, the machine beeps intermittently and the following message replaces the first -
I/O TIMEOUT ON SELECT CODE select code
The I/O device can be made usable by correcting the error (loading paper, or changing the select code, for example), then executing the READY\# command -

```
READY# select code
```

This command readies the I/O device and the operation which was attempted is attempted again. The select code must be specified by an integer.

If you get an I/O error on select code 0 and the printer is not out of paper, call your Sales and Service Office.

In some cases, such as an interface which is not connected. READY\# for that select code may not solve the I/O error. In this case, STOP should be pressed to regain control of the computer. Be sure to turn the power off before inserting an interface. After the problem is remedied, the operation or program can be tried again.

If you get an I/O error and you have an ON KBD statement in effect, you must press STOP to gain control of the computer. Otherwise, the READY\# command will be trapped by ON KBD.

## CSTATUS Element 0 Errors

10 Timeout before connection
11 Clear to Send line false or missing clock
100 Channel MEMLIMIT overflow
101 Illegal protocol from remote
102 Input buffer overflow
103 Internal buffer overflow
104 Autodisconnect forced
105 RETRIES count exceeded
106 NOACTIVITY timeout
20098046 buffer overflow

## Assembly-Time Errors

DD Doubly-defined label
EN END instruction missing; or module name does not match.
EX Expression evaluation error
LT Literal pools full or out of range.
MO ICOM region overflow.
RN Operand out of range.
SQ Argument declaration pseudo-instruction out of sequence.
TP Incorrect type of operand used.
UN Undefined symbol.
900-999 Reserved for user.

## IMAGE Status Errors

The following are possible values and meanings of the condition word (first element of the status array). After an error, the status array is as follows -

| Element | Description |
| :---: | :--- |
| 1 | Condition word is non-zero |
| $2-4$ | No change |
| 5 | DBOPEN mode |
| 6 | Statement identification number |
| 7 | Program line number |
| 8 | 0 |
| 9 | Value of the mode parameter |
| 10 | Integer-for system use only |

Each statement has an identification number.

| Number | Statement |
| :---: | :--- |
| 401 | DBOPEN |
| 402 | DBINFO |
| 403 | DBCLOSE |
| 404 | DBIND |
| 405 | DBGET |
| 406 | DBUPDATE |
| 407 | DBPUT |
| 408 | DBDELETE |

## Condition

Word Value Error Description
$0 \quad$ Successful execution - no error

- 1 Improper data base name; already have read/write access to the data base
-10 You may not open additional data bases; five are already opened
-11 Bad data base name or preceding blanks missing. Don't change the first two characters. Data base may not be open.
$-14$
DBPUT, DBDELETE and DBUPDATE not allowed in DBOPEN mode 8
-21 Bad password - grants access to nothing or not to that set. Check spelling. Data item, data set, or volume nonexistent or inaccessible. Check spelling and DBOPEN password. Volume references must be numeric for DBINFO.
-31 Improper mode in data base statement. DBGET mode 5 bad - specified data set lacks chains
Detail data set required
You lack write access to this data set
DBPUT or DBUPDATE not allowed on Automatic Master. Check correctness of set reference.

Item specified is not an accessible key item in the specified set. Bad @ parameter - must be "@;" or "@" or "@".
Root file name in disc directory and name in root file are different. Make sure root file not moved or renamed.
Root file version not compatible with current IMAGE/45 statements. Incorrect version of Schema Processor used.

Data base requires creation
Data or structure information lost. Data base must be erased or redefined.
Cannot DBOPEN while a DBBACKUP or DBRECOVER is going on.
End of file on serial DBGET: no entries following the current record.
Negative record number on directed DBGET. Check record number and spelling.
Record number greater than capacity on directed DBGET. Check record number and spelling.
End of chain encountered
The data set is full
No current record or the current record is empty: make sure that a current record is defined for this set. There is no chain for the key item value. There is no entry with the specified key value
Broken chain. Must UNLOAD the data base.
DBUPDATE will not alter a key item. Make sure correct key item values are in the correct places in the buffer string.
Duplicate key item value in master not allowed.
Can't delete a Master entry with non-empty detail chains
Buffer string is too small for requested data. Redimension if necessary.
Argument parameter type incompatible with key field type (DBGET, mode 7 or DBFIND) or current length of string argument is less than the string length of the key item value.
Data set's volume is not on line: or set not created.
Corrupt data base successfully opened in mode 8
There is no chain head for path $x x$
The automatic master for path xx is full
The master data set for path xx is not on-line (Applies to DBPUT and DBDELETE for detail data sets)
Root file volume isn't mounted.
Needed volume on-line: created data set xx isn't there

## 9845B/C Mainframe Service Notes

## Chapter

11

Service Notes will be published in Support Update. They are printed in reduced size for placing in this binder. Remove them from the Support Update, punch them and piace them behind this page.

## How to Punch the Service Notes

A problem arises in that six-hole punches are not widely available. The Service Notes may either be punched with a hand punch, or a three-hole punch may be adjusted to punch the Handbook pattern.

To modify a three-hole punch to punch the Handbook hole pattern, follow these directions:

1. Most punches have an inch scale to position the individual punches. This scale has zero in the middle, and increases to the left and right. Move the individual punches to the $17 / 8$, $25 / 8$ and $33 / 8$ positions. The punches can be on either the left or the right (or any combination) as long as each number has a punch on it.
2. Center the page to be punched on the scale. That is, put the left edge on the same number on the left scale as the right edge is on the right scale. For an $81 / 2$ inch page this will be $4 \frac{1}{4}$.
3. Punch the page, then turn it over, center it and punch it a second time.

11-2 9845B/C Service Notes
Service Notes (continued)

[^0]:    1 Ignore the references to the sliding lock handles if the 9845 C is not equipped with the sliding lock mechanism.

[^1]:    $1 \mathrm{mR} /$ hour: Milli-Roentgen per hour

[^2]:    UL and CSA approved for use in the United States of America and Canada with equiprnent set for elther 100 or 120 Vac operation.
    ${ }^{2}$ UL and CSA spproved for uee in the Unhed Statet of America and Caneda whth equipment set for etther $\mathbf{2 0 0}$ or $\mathbf{2 4 0}$ Vac operation.

[^3]:    1 These tests are in the 9845B/C CRT sectionof the CE handbook.

[^4]:    
    
    
    
    
    
    
    
    

[^5]:    Included with all 9845B/C Option 175, 275 and 280 mainframes
    FCC Class A and VDE (level A) approved
    $\ddagger$ HP-l8 mass storage devices require a dedicated 98034 B Opt. 445 HP -IB Interface

[^6]:    1 This error occurs when data is lost in the process of reordering the array. If this error does not occur. it does not necessarily imply that the pornter array contains a permutation.
